## Packing List

---

- One (1) WebMux™ unit
- One (1) Power cord
- One (1) User Manual
- One (1) Warranty registration card

## Main Components

---

### Front View

#### **Toggle Power Switch**

This switch toggles power on and off. To power off, the switch must be pressed and held for 5 seconds. However, it is recommended that you do not regularly use this power switch to shut down the unit. Please use the web interface or command line interface to issue a proper shut down.

#### **Reset Button**

Press and release the reset button to reboot the WebMux™. This is a hard reboot, not a factory reset. This will not reset your settings. Please allow several minutes for the WebMux™ to completely reboot.

#### **Up Arrow Button, Down Arrow Button**

When each button is pressed, the value on the cursor location increases or decreases. It goes through lower case letters, upper case letters, numbers and symbols. When the cursor is located at the left most position on the LCD, the up and down arrow allows the user to select a different item to setup.

#### **Left Arrow Button and Right Arrow Button**

When each button is pressed, the cursor moves to the left and right.

#### **Check Mark Button, and Cross Button**

Check Mark Button confirms the selection, Cross Button cancels the selection. At any time when the system is running holding down to the Check Mark Button will invoke the configuration menu, where you can change IP addresses and other settings.

## Rear View

### Server LAN Port

Connect this port to the Server LAN switch or hub. This port connects to the servers and your local computers. It is the right most RJ45 socket. In Out-of Path configuration, this is the only port that needs to be connected. If your switch is capable of LACP (or port channel), you can connect both the Internet and Server ports and they will behave as a single port (Out-of-Path mode ONLY).

### Backup WebMux™ Port

Optionally, you may connect another WebMux™ to this port so that you can have redundancy. Connect them using a cross over cable, or a regular cable with a hub or switch in between.

### Router LAN (Internet) Port

Connect this port to the Router LAN switch or hub. In most situations, this port connects to the Internet side network in NAT mode. It is the left most RJ45 Socket.

**PLEASE NOTE:** The Router LAN and Server LAN port are not interchangeable.

### External Modem Connect Port

To utilize the phone pager function of the WebMux™, please connect the external modem to this port. In some cases, if you prefer support engineers to not use diagnostic ports over the Internet, our support engineers can also connect through the modem to assist you with setup issues. A US Robotics V.Everything modem is required: US Robotics part number 3CP3453. Modem dip switch has 3, 8, and 10 down, rest up. A standard external modem cable is also needed. Check with your modem supplier for the cable.

### Main Power Switch

This switches the WebMux™ on and off. When in the "off" position, the front panel power switch is disabled.

### Power Cord

Please use the supplied power cord to connect the WebMux™ to the power source. 1U WebMux™ has a 115V/230V AC universal power supply.

## WebMux™ Overview

---

### Key Features

The WebMux™ is a standalone network appliance designed primarily to load balance IP traffic to multiple servers. The WebMux™ includes the following key features.

- **Improves performance** by distributing the traffic for a site or domain among multiple servers. No one server will be bogged down trying to service a particular site.
- **SSL Termination** to reduce the cost of multiple certificates. Also, be able to regulate the minimum acceptable SSL encryption protocol version.
- **Provides high availability** by tracking which servers are functioning properly and which servers are out of service. If a server unexpectedly goes down, the WebMux™ will automatically re-direct the traffic to other servers, or will bring a standby or backup server online to service the traffic. The WebMux™ does application level health check to many network protocols on servers.
- **Provides Persistent Connections** by memorizing the user browser session and the server session and sending the same user to the same server. This is important for sites using shopping cart and dynamically generated pages, like BroadVision, ASP and JSP sites.
- **Provides fault tolerance.** This installation requires two WebMuxes, a primary and a secondary. The two WebMuxes will automatically sync the configuration datum.
- **Easy management.** It can be managed via a secured web browser session from anywhere in the world. By using https 128 bit encryption to the management web console, secure remote management of server farms is truly possible.
- **Operating System independent.** No software or agent to load on the servers. Non-intrusive load/failure detection and management.
- **Provides Proxy function.** When communication is initiated from behind the WebMux™, the WebMux™ will substitute its own address for the internal address. This allows the web servers to initiate communication for

services such as credit card validation and mapping services. (Note: this function only works in NAT mode).

- **Built-in Firewall Protections (layer 4/5 only).** Stop possible hacker intrusion into your network from Internet. All IP addresses and ports are blocked except the farm IP address. Built-in functions will detect any possible denial of service attack and make your services always available. (Note: this function only works in NAT mode with “Forwarding Deny”, see setup for details).
- **Built-in Anti-Attack Security Function.** Automatic protection against Denial of Service (DoS) and Distributed Denial of Service (DDoS) attacks. Automatically block IP addresses that exceed the maximum threshold of concurrent connections for a specified amount of time. Works in NAT, Transparent, and OOP modes.
- **In-Path or Out-of-Path Load Balancing.** In normal setup, the WebMux™ can be configured In-Path, to act as firewall in addition to the load balancer and health checker. However, if outbound traffic is much larger than inbound traffic and you already have a firewall in place, or change of IP address causes problems, consider using Out-of-Path configuration. Out-of-Path load balancing is also called direct routing, or one leg operation.
- **Transparent Mode.** In this mode, the WebMux™ behaves as an Ethernet bridge between the Server LAN and the Router (Internet) LAN. The main advantage is that the network settings in the servers do not have to be changed, no loopback adapters or IP address changes needed. The servers will be connected behind the WebMux™ but will appear to be on the same LAN that the front network the WebMux™ is connected to.
- **Layer 7 Load Balancing.** WebMux™ can direct traffic to specific groups of servers within a farm according to a match pattern in the HTTP MIME header. This allows you, for example, to group servers that serve only a specific type of content while serving other types of content on another group of servers. WebMux™ Layer 7 load balancing also includes URI load directing with host name MIME header matching and cookies in order to memorize the user browser session and the server session and send the same user to the same server. This is important for sites using shopping cart and dynamically generated pages.
- **Informs you of the status of your network.** It provides phone pager and email notification so that the network administrator can be paged or emailed whenever a server or WebMux™ goes down, and when it returns online. This feature could reduce server room night shift operator costs, or timely repair should the server go down unexpectedly.

- **SNMP Support.** Remotely monitor various WebMux parameters in real time via SNMP.
- **IPv6 Support.** (Out of Path mode only). WebMux™ is ready for the next generation of internet protocol, IPv6.
- **Multiple Address and Port (MAP) farm** to integrate multiple ports and IPs as one virtual service.
- **HTTP Compression.** Reduces amount of data to be transferred for HTTP objects. (NOT supported in Out-of-Path Mode, except when used with Layer 7 Load Balancing).
- **802.1q VLAN ID.** WebMux can be used in networks that support tagged VLANs. Switch port must be configured to use tagged VLAN.
- **Multiple Uplink/VLAN Support.** Using the command line interface command, `nwconfig`, WebMux can be configured for use with Multiple ISPs. You can also use this command line tool to create multiple server subnets. Please see Appendix 12 for details.
- **Single-sided Transparent Mode.** Allows you to set up transparent mode with only one physical network.
- **Bond All Interfaces.** In combination with 802.1q VLAN and Port Channel or LAG (Link Aggregation Group) configurations on the switch, you can configure the WebMux to use its “Internet/rtr” and “Server/svr” ports as a single “bonded” interface in NAT and Transparent Modes. The traditional front and back networks will now be dependent on the VLAN configurations on the switch. Please refer to Appendix 14 for details. (Note: Out-of-Path mode already has both interfaces bonded automatically).

## The WebMux™ Family

The 1U WebMux™ family consists of three models. They are:

- The WebMux™ 481SD
- The WebMux™ 591SGQ
- The WebMux™ 680PG

The table below compares the features of the models.

Model Number:	481SD	591SGQ	680PG
<b>Layer 4 Performance</b>			
Maximum concurrent connections	1,440,000*	2,880,000*	5,760,000*
Maximum transactions per second	65,000	100,000	200,000
Maximum throughput per second*	1.1 GBits	2GBits	4GBits
Maximum Internet link speed	4 X T3	2 X OC-12	1.5 X OC-12
<b>Layer 7 &amp; SSL Acceleration</b>			
Max. 1024bit RSA terminations/second (round trip)	300	600 1600** 2600***	2000
Max. Layer 7 connections/s	50,000	100,000	144,000
Number of SSL certificates	32	32	32
<b>Load Balancing Methods</b>

\*\*\* With CAI-RSA7000 option card

## Network Overview

The WebMux™ has four modes: In-Path, or NAT (Network Address Translation), Out-of-Path mode, Transparent (Ethernet Bridge) Mode, and Single-Sided Transparent Mode. Each mode has its advantage and disadvantages. Let us look at NAT mode first.

The main purpose of the WebMux™ is to balance the traffic among multiple web or other servers. The diagram above shows a NAT installation with two WebMuxes. In this configuration, one WebMux™ is serving as the primary, and the other is serving as the secondary, or backup, providing a fault tolerant solution.

In order for the web servers to share the incoming traffic, the WebMux™ must be connected to the network. There are two interfaces on the WebMux™. One interface (Internet) connects to the **Router LAN**. This is the network to which the Internet router is connected. The other interface (server) is connected to the **Server LAN**. This network connects to all the web servers. The WebMux™ routes traffic between these two networks.

Next, a **Virtual Farm** or multiple farms must be configured on the WebMux™. A virtual farm is a single representation of the servers to the clients. A farm consists

of a group of servers that service the same domain, website or services. For example, to configure a farm (or virtual farm) to serve www.cainetworks.com:

- First, Server 1 and Server 2 would each need the website www.cainetworks.com configured on them and HTTP/HTTPS services started, and
- Second, a farm on the WebMux™ is defined with Server 1 and Server 2 in it. The servers would be setup to either share the traffic, or setup as a primary server and standby server. In either case, if Server 1 goes down, then all traffic will be automatically directed to Server 2 by the WebMux™.

In Out-of-Path mode, only one network in the setup (the server LAN) is connected to the Internet through the firewall and router. Internet traffic or local connections can both be directly sent to the WebMux™, which routes the packets to the proper server(s), then the server routes the return traffic back to the remote or local clients directly.

In most situations, the incoming traffic is in small requests, and return traffic from servers back to clients is large amount of data, pictures, or documents. Using out-of-path mode will allow up to 100 times more traffic to be handled by the

WebMux™ load balancer. The disadvantage for OOP/direct response is that the firewall protections built-in to the WebMux™ will no longer function. Users must provide their own firewall for incoming and outgoing traffic.

## Sample Configurations

### Single WebMux™ (NAT mode)

- This installation requires one WebMux™.
- One WebMux™ interface (Internet) connects to the Router LAN. The other interface connects to the Server LAN.
- The WebMux™ translates the Router LAN IP addresses to an internal non-routable class-C address. In this example, the netmask is 255.555.255.0. The IP address of the WebMux™ interface on the Router LAN is 205.133.156.220. The IP address of the WebMux™ interface attached to the Server LAN is 192.168.199.251.
- The Default Gateway for all the servers is 192.168.199.1.
- Farm 1 IP address is 205.133.156.200. Servers 1 and 2 serve Farm 1.

- Farm 2 IP address is 205.133.156.210. Servers 2 and 3 serve Farm 2.
- Changes to the server: change the default gateway to 192.168.199.1, as well as the IP address to the 192.168.199.xxx address. If on the server there is a service attached to the IP address (HTTP/S, FTP, etc), please make sure the service will run on the new IP address.

**NOTE:** Although the WebMux™ can work with any IP address range, all server IP addresses should be Internet non-routable address so that the source address from the Internet does not conflict with the IP addresses on the Server LAN.

**NOTE:** If there is a firewall between the WebMux™ and the Internet Router, a rule must be defined in the firewall to allow the IP address of the WebMux™ interface on the Router LAN along with the farm IP address to communicate out to the Internet on all ports. If you are doing Network Address Translation of the farm address to a non-routable address, then both the farm address and the WebMux™ interface address must be translated to communicate outbound on all ports.

## Redundant Installation (NAT mode)

- The installation requires two WebMuxes. One will be the primary, and the other the secondary. They connect together with the Ethernet cable that is either cross-over or through a hub or switch. The primary's Backup interface IP address is 192.168.255.253; the secondary's Backup interface IP address is 192.168.255.254. They cannot be changed.
- Both WebMuxes connect to the Router LAN, and to the Server LAN. Each WebMux™ interface has a unique IP address.
- The registered Internet IP address range is a class C address range.
- The IP address of the WebMuxes' Virtual Farms must be in the same network range as the Internet router.
- The WebMux™ translates the Router LAN IP addresses to an internal non-routable class A address. In this example, the subnet-mask is

255.0.0.0. The IP address of the WebMux™ interfaces attached to the Server LAN are 10.1.1.10 and 10.1.1.20.

- The Default Gateway for all the servers is 10.1.1.1.
- Farm 1 IP address is 205.133.156.200.
- Servers 1 and 2 serve Farm 1.
- Farm 2 IP address is 205.133.156.210.
- Servers 2 and 3 serve Farm 2.
- Changes to the servers: change default the gateway to 10.1.1.1, as well as the IP addresses to the 10.3.1.10/20/30 addresses. If on the server there is a service attached to the IP address (HTTP/S, FTP, etc), please make sure the service will run on the new IP address.

**NOTE:** Although the WebMux™ can work with any IP address range, all server IP addresses should be Internet non-routable address so that the source address from the Internet does not conflict with the IP addresses on the Server LAN.

**NOTE:** If there is a firewall between the WebMux™ and the Internet Router, a rule must be defined in the firewall to allow the IP address of the WebMux™ interfaces on the Router LAN in addition to the farm IP address (could be same as the WebMux™ Router LAN IP address) to communicate out to the Internet on all ports. Since the WebMux™ is doing Network Address Translation of the farm address to a non-routable address, the farm addresses on the WebMux™ must be able to communicate outbound on all ports defined in the farms.

## Installation without IP Address Change (Out-of-Path Mode)

Out-of-Path Mode:

The above diagram is an example about how to configure the WebMux™ in Out-of-Path mode without changing the IP addresses of the web servers and other servers that already exist on the network. This is particularly helpful when the changing of an existing network of servers causes problems.

In this configuration, all the servers still remain on the same IP network and can communicate. From the servers “view”, the WebMux™ is on the same network as the servers. On the WebMux™, only the server LAN cable is connected, since there is only one network in Out-of-Path mode. The WebMux™ takes at least two IP addresses to work in this mode, the server LAN Interface IP address and the farm IP addresses.

If you are connected to a manageable switch that allows you to create Link Aggregation Groups (LAG), sometimes called “Ether-Channel” or “Port Channel”, the Internet port and Server port on the WebMux can be connected to the switch and will behave as one logical port with about twice the bandwidth capabilities. It is important that you configure the switch properly before connecting both interfaces. Please refer to your switch’s user manual about creating Link Aggregation Groups.

Out-of-Path mode also allows two WebMuxes to fully backup each other. The two WebMuxes are connected to each other through a cross-over Ethernet cable or with a hub or switch in between.

Two simple changes must be made to each server in the farm. 1) Have a new loopback adapter installed and have its address set to the farm address. Do not set the gateway on the loopback adapter. Please refer to Appendix 1 and Appendix 2 for how to configure a loopback adapter, as well as how to remove the route from the servers. **Please note for Out-of-Path mode to work properly, the loopback adapter must route the return traffic through the real network interface. In other words, the loopback adapter cannot have the gateway specified. Please refer to Appendix 1 and 2 for more details on how to configure the loopback adapter on servers. In case the server is running Windows 2003/2008, the route created when adding loopback adapter cannot be deleted; please make sure the loopback adapter metric has a higher number.** 2) If your service binds to any specific IP address, add the loopback adapter's IP address to that service.

The firewall configuration must be changed to point to the new farm address on the WebMux™. Since the WebMux™ always uses one IP address in the server LAN, the farm address must be a different IP address in the server LAN in Out-of-Path mode.

**NOTE:** Under normal Out-of-Path operations, you will only need to set the external gateway IP address for the WebMux™. However, if you are going to have the WebMux™ do SSL termination or Layer 7 load balancing, you must set a "server LAN gateway" IP in the WebMux™ and have the servers' default gateway point to that IP address.

## Installation without IP Address Change (Transparent Mode)

### Transparent Mode:

\*STP = Spanning Tree Protocol

Transparent Mode is another WebMux™ configuration that allows you to keep the existing IP addresses of your servers. Like Out-of-Path mode, the servers and the WebMux™ will be on the same IP network. However, physically, the servers will be connected to the WebMux™ in the same way they would be for NAT mode, on the server LAN port. The “internet” port on the WebMux™ is connected towards the Firewall/Router. In this mode, the WebMux™ functions as an Ethernet bridge. Anything connected to its back interface (server LAN) is on the same network as its front interface (internet/router LAN). If you look at the diagram above, you will see that the terminals are on the same network as the servers, even though the servers are “behind” the WebMux™. The terminals can communicate with the servers IP directly as if the WebMux™ was not there, and vice versa.

When creating a farm, choose a unique farm IP address in the network, and then add the server IP address under that farm. Load balancing occurs when the “Farm IP” is accessed instead of the servers’ actual IP.

There are no configuration changes that need to be made on the servers, only the way they are physically connected to the network.

The diagram also gives an example of a redundant WebMux™ setup. In this case, it is **absolutely required** that the WebMuxes™ are connected in between two switches that have Spanning Tree Protocol (STP) enabled. STP controls the path where packets go in the existence of redundant Ethernet bridges according to bridge priority so that loops do not occur. Without this, packets will loop endlessly between the WebMuxes™ and saturate their network path.

During a failover situation, you may immediately notice that the backup becomes unreachable even though the LCD shows that it is active. This is a temporary situation as the switches detect new bridge priorities. This failover time usually takes about 1-30 seconds, depending on the switch and the different STP protocol selected. This also happens when the primary comes back online and the secondary returns back to standby mode.

For a single WebMux setup, any kind of switch will work, since there is only one bridge path on the network. No Spanning Tree Protocol is required.

## Installation Without IP Address Change (Single Sided Transparent Mode): Single-Sided Transparent Mode

Single-Sided Transparent Mode configuration is almost like Out-of-Path mode, with only one interface connected to the network. You can use either the Internet Port or the Server Port of the WebMux, but only one of them. The WebMux™ and the servers are also all on the same subnet. However, you do not have the option to bypass the WebMux™ for the return traffic as you would in Out-of-Path mode. The server's default gateway must point back to a farm IP address on the WebMux™. It is important that you use a farm IP address and not the WebMux™'s bridge IP address. The bridge IP address is unique for each WebMux™. If you have a redundant installation and you use the primary WebMux™'s bridge IP address as the server's default gateway IP address, it will work, but if the primary goes down, that IP address will be gone and the server's will have no valid gateway. Farm IP addresses are transferred from one WebMux™ to the other in a failover situation. Using the farm IP address as your server's default gateway will ensure that they will have a valid gateway should a failover situation occur.

If you are configuring a redundant configuration in Single-Sided Transparent Mode, be sure you have selected the "1-sided" option in both WebMux™'s' initial configuration shown in the following section to ensure that the failover checking between the two WebMux™es will be correct.

## Configuring the WebMux™

### Before you Start

Please collect the information about names and IP addresses designated by the arrows in the network topology below.

### Network Terminology

A **Virtual Farm** includes the WebMux™ and the servers under it. Functionally, it acts as a single unit on a network. For example, <http://www.you.com> is one virtual server farm; <https://www.me.com> is another farm, and <ftp://ftp.cainetworks.com> is the third farm. The first farm works on a set of servers on port 80, the second farm consists of another set of servers on port 443, and the third farm works on a set of servers on port 21. The WebMux™ supports combining 80/443 ports as one single farm, so that same client browsing the site in HTTP mode will be sent to the same server for HTTPS requests. In the combined configuration, you must select HTTP/S as the farm service. Ports 80/443 will then be combined into one farm.

To serve the Internet, there must be at least one **Internet Router**. The local area network that connects the router and the WebMux™ is called the **Router LAN**. In this LAN, the WebMux™ takes the Internet traffic and distributes it to the servers behind it. The LAN connecting the WebMux™ and real servers together is called **Server LAN**.

WebMux has three modes: NAT mode, OOP mode, and Transparent mode. In NAT mode, the WebMux™ boxes are connected to both **Router LAN** and **Server LAN**. At least one WebMux™ is needed to define the **Router LAN** and the **Server LAN**. We will explain other modes in detail in later chapters.

The side of the WebMux™ that connects to the **Router LAN** sends and receives all the IP packets from the router to the Internet. The side of the WebMux™ that connects to the **Server LAN** sends and receives IP packets to and from the servers in the farms. By properly configuring the WebMux™, one can create one or more Virtual Farms on top of the physical hardware.

## Hardware Setup --- Collect Information

- Make a drawing of the existing network and note all the configuration settings. This will help you to fall back to the existing configurations if needed.
- Make a new drawing for the new setup with the WebMux™ and the web farm in place. This will be used as a guide for setup and preparation of all the necessary material and equipment.
- Collect all the IP addresses, their network masks, network addresses, and broadcast addresses for the Server LAN and Router LAN WebMux™ interfaces. The IP address of the Internet router is also needed.
- Label all the cables. Prepare additional cables if needed.
- Make sure there are enough electrical or UPS outlets for all the new equipment.

## Hardware Setup ---Setup the new network

- Power down all the devices on the network.
- If you have a secondary WebMux™, connect the WebMuxes with a cross-over Ethernet cable.
- Connect the servers to the Server LAN
- Connect the WebMux™(es) to the Server LAN

- Connect the WebMux™(es) to the Router LAN (NAT and Transparent mode, Server LAN in OOP mode).
- Power up all devices in the network.
- Verify that all the devices are up and running.
- You are now ready to configure WebMux™.

## Hardware Setup ---Configuration Summary

**CAUTION:** *Do not* proceed without collecting all necessary information.

**NOTE:** The IP addresses in the following examples are general examples and are not meant for literal use in an actual setup.

- Turn on the WebMux™. Turn on the switch on the back of the WebMux™ and push the power-on button in the front momentarily. You will see the version number like this:

- After self-test, hold down the Check-Mark button on the WebMux™ until the LCD displays the first question – “**Enter WebMux host name**”.
- During the initial configuration, you will be asked to provide names and IP addresses. (See next section.) Each item is explained in the order it is asked.
- Answer the questions. Reboot. **Note:** When reboot is complete, the service statistics screen will appear.
- Run the Management Browser.

## Initial Configuration

Enter WebMux™ Host Name:

Enter the host name of the WebMux™. Use the right arrow to move the position, the up and down arrows to select characters, left arrow to move back in position, check mark button to confirm the change. This host name is for identification purposes. You may call it webmux1, webmux2, etc. (You can hold down the up/down button for more than a second to make quicker changes.) Note the left most down arrow on the LCD allows the user to move to other settings.

Enter WebMux™ Domain Name:

The LCD screen displays the text "domain" on the first line and "cainetworks.co" on the second line. A small up/down arrow icon is positioned to the left of the second line, and a small square icon is at the end of the second line.

This is for identification only; this has no effect for network operation. Although it can be any name, we suggest using the primary domain name of the Router LAN network. If you have only one domain, use that domain name. Note the left most position on the LCD has changed to an up and down arrow, allowing the user to go back and forth for questions and answers.

Is this a Primary WebMux™?

The LCD screen displays the text "Primary webmux?" on the first line. The second line shows "\*YES" and "NO" with a small up/down arrow icon to the left.

If this is the Primary, answer Yes. If this is the Secondary WebMux™, answer No. The secondary WebMux™ automatically gets configuration information from the Primary once it sets up. If this is the only WebMux™, answer Yes.

Primary WebMux™ Information

This question is not asked for the Secondary WebMux™.

Is this WebMux™ running solo without a backup WebMux™?

The LCD screen displays the text "running solo?" on the first line. The second line shows "YES" and "NO" with a small up/down arrow icon to the left.

If the Primary WebMux™ is running in a standalone configuration (see sample configuration – Standalone WebMux™.), answer Yes. If you plan to add 2nd WebMux™ in the future, you may answer NO, even there is only one WebMux at the time. When you add second WebMux™ later on, WebMux™ will automatically detect the backup and start functioning.

Choose NAT mode or Out-of-Path Mode:

The LCD screen displays the text "use svr LAN NAT?" on the first line. The second line shows "\*YES" and "NO" with a small square icon to the left.

This is where to choose NAT (Network Address Translation) or Out-of-Path mode. “\*” is a default or selected option. Network address translation provides protection to the servers; it can handle large amounts of data as noted in the specification. It provides the best security for isolating servers from any other part of the networks. Out-of-Path provides better performance when huge amounts of data need to go back to clients (up to 100X more than on the specification chart); it also does not require a change to the server IP address. If you select NAT, continue to the next setting. If you answer NO here, please continue setup at the *Out-of-Path Related Configuration* section.

Transparent Mode:

```
transparent mode
*YES      NO
```

If you select NAT mode, you can select Transparent mode (bridge mode) or not. If you choose YES, the WebMux™ will be in Transparent Mode and will behave as an Ethernet Bridge.

```
1-sided tr.mode?
YES      *NO
```

This option will allow you to select whether or not you plan to use Single-Side Transparent Mode.

Please continue the configuration to the *Transparent Mode Related Configuration* section.

## NAT Mode Related Configuration

Enter Router LAN WebMux™ Proxy IP Address:

```
rtr LAN ip addr
205.133.156.200
```

This is the IP address that the WebMux™ uses as the external IP address when it functions as a proxy. (This IP address can be also be used as a farm IP). When any server behind the WebMux™ (on the Server LAN) initiates communication with another host, the WebMux™ substitutes the servers' IP address with this address. (This is true for all services, except FTP services, which uses the FTP farm IP address for passive FTP connection). In a redundant setup, the secondary WebMux™ can also the same IP address for

this entry as the primary unit. This address floats between primary and secondary WebMuxes. This is not true in Transparent or OOP modes. Doing so will create duplicate IPs.

Enter Router LAN Network IP Address Mask:

```
rtr LAN net mask
255.255.255. 0
```

This is the network mask of the Router LAN network. It is usually 255.255.255.0 for class C networks.

Enter Server LAN WebMux™ IP Address:

```
svr LAN ip addr
192.168.199.251
```

This is the IP address of the WebMux™ interface that connects to the Server LAN. This IP address must also be unique for each WebMux™. **This address must be different from the server LAN gateway address.** The purpose of this IP address is to allow the WebMux™ to check the network and server health situation. Even for the backup WebMux™, this address must be unique. It is highly recommended to add this IP address to your servers /etc/hosts file, along with the gateway IP address, to allow faster name resolution, especially on Linux/Unix.

In an installation with a primary and secondary WebMux™, a unique IP address is required for each WebMux™ interface that connects to the Server LAN. Those two unique IP addresses are in addition to the gateway IP address that is floating between the primary and secondary WebMux™.

These IP addresses cannot be your Internet registered addresses. They must be Internet non-routable. For example, you can assign addresses in a 10.0.0.0 network address range, or a 192.168.199.0, etc.

Enter Server LAN Network IP Address Mask:

```
svr LAN net mask
255.255.255. 0
```

This is the network mask of the Server LAN. For a class A network, it may be 255.0.0.0. For a class C network, it may be 255.255.255.0.2

Enter Router LAN VLAN ID (optional):

```
rtr LAN vlan id
┆ .....200
```

This is the optional VLAN ID tag that will be used for the Router LAN (Internet) interface. You may enter values from 1 – 4067. The cursor position will only go from 0 to 9. To enter a value greater than a single digit, press the left arrow button to move the cursor to the next digit. Enter zero (0) to disable the VLAN ID for the Router LAN (Internet) interface.

Enter Server LAN VLAN ID (optional):

```
srv LAN vlan id
┆ .....300
```

This is the optional VLAN ID tag that will be used for the Server LAN (Server) interface. You may enter values from 1 – 4067. The cursor position will only go from 0 to 9. To enter a value greater than a single digit, press the left arrow button to move the cursor to the next digit. Enter zero (0) to disable the VLAN ID for Server LAN (Server) interface.

**NOTE:** The VLAN ID is used for full 8021q VLAN support. That means your switch must be configured to be using “tagged” VLAN. Please see Appendix 11 for other details about using VLAN with WebMux™.

If you entered a non-zero value for the VLAN IDs, you will see an additional screen:

**“Bond rtr/svr NI?”** (“Bond router and server Network Interfaces)

This option will allow you to use the “Internet/rtr” port and “Server/svr” port as a single “bonded” interface, also known as Port Channel or Link Aggregation Group, allowing substantially more data throughput than a single physical interface. Please refer to Appendix 14 for details.

Enter Server LAN Gateway IP address:

```
srv LAN gateway
┆ 192.168.199. 1
```

This IP address will be the Default Gateway entry for all the servers on the Server LAN. In an installation with two WebMuxes, if a gateway IP address of 10.1.1.1 is used, this address will ‘float’ between the primary and secondary WebMux™. If the Primary went down, the 10.1.1.1 address will float to the backup. Please pay very careful attention that THIS IS NOT YOUR EXTERNAL ROUTER/GATEWAY IP. The IP address you put here will be assigned to the Server LAN interface. Make sure it is a unique IP address.

In the single WebMux™ setup, this address CANNOT be the same as the WebMux™ IP interface address on the Server LAN. When configuring a backup unit, this screen will not be displayed. Please continue to the Common Configuration section.

## Transparent Mode Related Configuration

Enter Bridge IP Address:

```
bridge ip addr
■192.168. 11. 32
```

This will be the IP address of the WebMux™ on the network so that you can use browser to manage it. Although the “server” and “internet” ports are interchangeable in transparent mode, it is recommended that you stick with labeling scheme and connect the port labeled “internet” to the switch on the firewall/router side and connect switch on the servers to the port labeled “server”.

Enter Bridge Net Mask:

```
bridge net mask
◆255.255.255. 0
```

This should match the net mask of the existing network the WebMux™ will be a part of.

Enter Router LAN VLAN ID (optional):

```
rtr LAN vlan id
◆ .....200
```

This is the optional VLAN ID tag that will be used for the Router LAN (Internet) interface. You may enter values from 1 – 4067. The cursor position will only go from 0 to 9. To enter a value greater than a single digit, press the left arrow button to move the cursor to the next digit. Enter zero (0) to disable the VLAN ID for the Router LAN (Internet) interface.

Enter Server LAN VLAN ID (optional):

```
srv LAN vlan id
■ .....300
```

This is the optional VLAN ID tag that will be used for the Server LAN (Server) interface. You may enter values from 1 – 4067. The cursor position will only go from 0 to 9. To enter a value greater than a single digit, press the left arrow button to move the cursor to the next digit. Enter zero (0) to disable the VLAN ID for Server LAN (Server) interface.

**NOTE:** The VLAN ID is used for full 802.1q VLAN support. That means your switch must be configured to be using “tagged” VLAN. Please see Appendix 11 for other details about using VLAN with WebMux™.

If you entered a non-zero value for the VLAN IDs, you will see an additional screen:

**“Bond rtr/svr NI?”** (“Bond router and server Network Interfaces)

This option will allow you to use the “Internet/rtr” port and “Server/svr” port as a single “bonded” interface, also known as Port Channel or Link Aggregation Group, allowing substantially more data throughput than a single physical interface. Please refer to Appendix 14 for details.

Please continue to the *Common Configuration* section.

## Out-of-Path Related Configuration

Enter Server LAN WebMux™ IP Address:

```
srv LAN ip addr
■ 192.168.199.251
```

In Out-of-Path Mode, at minimum, you only need to connect the Server LAN interface. This is the IP address of the WebMux™ Server LAN interface. This IP address must also be unique for each WebMux™. The purpose of this IP address is to allow the WebMux™ to check the network and server health. Even for the backup WebMux™, this address must be unique. It is highly recommended to add this IP address to your servers /etc/hosts file, along with the gateway IP address, to allow faster name resolution, especially on Linux/Unix. Please also refer to Appendix for adding loopback to servers.

In an installation with a primary and secondary WebMux™, one unique IP address is required for each WebMux™ interface that connects to the Server LAN. Those two unique IP addresses are in addition to the farm IP address that is floating between the primary and secondary WebMux™.

Enter Server LAN Network IP Address Mask:

```
srv LAN net mask
■ 255.255.255. 0
```

This is the network mask of the Server LAN. For a class A network, it may be 255.0.0.0. For a class C network, it may be 255.255.255.0.

Enter Server LAN VLAN ID (optional):

```
srv LAN vlan id
■ .....300
```

This is the optional VLAN ID tag that will be used for the Server LAN (Server) interface. You may enter values from 1 – 4067. The cursor position will only go from 0 to 9. To enter a value greater than a single digit, press the left arrow button to move the cursor to the next digit. Enter zero (0) to disable the VLAN ID for Server LAN (Server) interface.

**NOTE:** The VLAN ID is used for full 802.1q VLAN support. That means your switch must be configured to be using “tagged” VLAN. Please see Appendix 11 for other details about using VLAN with WebMux™.

Enter Server LAN Gateway IP address (optional):

---

```
svr LAN gateway  
192.168.199. 1
```

This is an optional configuration that is used only if you are going to do SSL termination or Layer 7 load balancing. Keep in mind this is an IP address assigned to the Server LAN network interface. Be sure to use a unique IP address or duplicate IPs on the network will occur. Enter 0.0.0.0 if not needed.

## Common Configuration

### -For NAT, Transparent, and Out-of-Path Mode

Enter External Gateway:

```
external gateway
■ 192.168. 11. 2
```

This is the common setup for NAT, Transparent, and Out-of-Path modes. This is an address on the firewall or router local interface. In NAT mode, the WebMux™ needs to know this to route the server replies back to the clients. Although in Out-of-Path mode this is not being used to route return traffic back to the Internet clients, the WebMux™ uses this IP address to check the connectivity of the external network on this gateway or through this gateway to the ISP side routers. For SSL termination or Layer 7 load balancing, servers must route traffic back to the WebMux™ via the server LAN gateway (previously mentioned). The WebMux™ then forwards it to the client through the external gateway. If health check on external gateway is enabled (by default), WebMux™ will turn the farm listing red to indicate the external gateway failure.

Clear Allowed Host File?

```
clr allowed hosts?
■ YES *NO
```

The allowed host file prevents any unauthorized access to the WebMux™ Management Console. If a workstation's IP address is not in the allowed host file, that computer will not be able to reach the WebMux™ management console through the network. However, sometimes a wrong IP address is entered so that no computer can access the browser management console. At that point, clearing the allowed host file will allow any browser to access it. By default, the allowed host list is empty so that any IP address can access WebMux™. We do encourage adding only host IP addresses that you do allow to manage WebMux™ into the list. See configuration through browser interface for more details.

Remake /home/WebMux/conf/passwd?

```
remake passwd?
◆ YES *NO
```

This function is provided in case you have forgotten the passwords to access the **Management Console**. Please use a browser to access Management Console for normal password changes. The factory default password is the same as the

login ID on the screen. Answer Y to reset the Passwords to factory default. Answer N to leave them unchanged.

Enter Admin HTTP Port Number:

```
http admin port
█ .....24
```

This is the http port number for accessing Management Console in non-secure mode. Any unused port number can be used. Factory default port number is 24, one could choose to use any unused port below 1024 or port number above 1024 for this. Using a port number above 1024 will require you to set up an “admin farm”. Basically, this is just a farm configured with that port, without any servers in it. Creating the “admin farm” reserves that port for use to that farm only and prevents port collision in case passive FTP is one of the other farms. Using port number below 1024 will not require setting up an “admin farm”.

Enter Admin HTTPS Port Number:

```
https admin port
█ .....35
```

This is the https port number for accessing Management Console in secure mode. Factory default port number is 35, one could choose to use any unused port below 1024 or port number above 1024 for this. Using a port number above 1024 will require you to set up an “admin farm”. Basically, this is just a farm configured with that port, without any servers in it. Creating the “admin farm” reserves that port for use to that farm only and prevents port collision in case passive FTP is one of the other farms. Using port number below 1024 will not require setting up an “admin farm”.

Discard Changes Made?

```
discard changes?
▲  YES  *NO
```

If you select Yes at this point, all the changes made will be discarded. By default the answer is NO, all the changes will be saved to internal solid state storage. Changes will take effect after next reboot.

The next question will be **Reboot Now?**

Reboot now?

```
reboot? (hold ✓)
▲
```

This is the end of initial configuration. Most of the setup or changes require a reboot to take effect. Press and hold the center Check-Mark button to make the WebMux™ reboot. Use the UP arrow button to return to “Discard Changes” and select “Yes” to exit without change. Press the DOWN arrow or Cross Button to continue to the Factory Reset option (see **Factory Reset** below).

REBOOT...

After the WebMux™ is rebooted, the statistics of the incoming packets, outgoing packets, etc will be displayed on LCD periodically.

webmux.cainetwor  
opkt /s: 0

### **Factory Reset:**

Pressing the “down” button or the “x” button at the “Reboot Now?” screen will bring you to the factory reset option. You will see:

FRESET? (hold ✓)

This option will clear all current settings and reset the WebMux™ to original factory settings. Press and hold the check-mark button for at least 20 seconds to activate the factory reset. The process will take a few minutes and the WebMux™ will reboot itself.

## **What if I made mistake in my configuration?**

You can always make changes to the hardware settings by press the Check-Mark button for three seconds when the statistic screen showing. It will start the prompt questions which will allow the you to navigate from one prompt to another by using the up/down button on the left most LCD position. For example, if you configured the Allowed Hosts wrong and lock yourself out, you can go to the push buttons and select “Clr Allowed Hosts” option, save changes and reboot, which will allow all the IP address to access the management console through browser. You can clear the allowed hosts but not reset the password, or change one option and not change the others.

## Management Console

---

After the Initial Configuration, you should be able to use a web browser to connect to the WebMux™. The web browser interface does all of the WebMux™ management. The following sections explain each of the easy to use management console screens.

- Login
- Administration Setup Page
  - Change Password
  - Set Clock
- Status
- Add Farm
- Modify Farm
- Add Server
- Modify Server

## Login

### Start Login Page:

- Start a web browser from your management workstation.
- Set URL to **https://webmuxip:webmuxport/**
  - **webmuxip** is the IP address of the WebMux™ on the server LAN.
  - **webmuxport** is the management port address of the WebMux™. The default ports are 24 for an unsecured connection, and 35 for the secured connection. Use http instead of https on the URL line if you decide to use port 24 for unsecured communications. (The port number can be changed per your specification, under “setup” in “main management console” section).
- The following login page will appear.

**NOTE:** In order to use a browser to manage the WebMux™, the browser must be set to accept all cookies.

### User ID:

There are two preset user IDs

Supouser - Allows access to all screens and functions provided by the WebMux™.

WebMux - Does not allow the user to access or change any settings; allows viewing only.

### Password:

Fill in the correct password for the selected User ID. The password is case sensitive.

The default passwords are:

ID	Password
superuser	superuser
webmux	webmux

It is recommended to change the passwords periodically. No new user ID can be added.

Login:

After entering the correct password, click Login.

**NOTE:** For first time setup, please login as **superuser** and go to the Administration Setup by clicking the **Setup** button. It is important to set up the Server Farm Gateway IP address and network mask first.

If only HTTPS management login is allowed, go to “setup” and make the first port number for HTTP/HTTPS management port to 0:35

**NOTE:** For customers who have configured TACACS+ support, the login screen will display the TACACS+ user login field and password. WebMux will validate the user to the specified TACACS+ server specified in the “Setup” screen. Please refer to that section for details.

## Main Management Console

Once logged in to the Management Console, this main screen will show. To continue configuring the WebMux™, the normal steps are:

Click on the “Setup” button to change administration and setup related information;

Click on “SSL keys” button to manage SSL keys, if SSL termination is desired;

Click on “Add Farm” button to create a new server farm;

Click on the “IP address” portion of the farm display to add servers;

Click on “Save” button to save the farm/server configuration.

Click on “services” on each farm to adjust the timeout for each kind of services. Note that same protocol services between farms will share the same timeout value.

We will discuss those buttons and related features in greater detail in later sections. Other buttons on the main management console screen are:

### Save

On the main management console, clicking on the Save button will cause the WebMux™ to save its configuration. Changes made to the “Farm” and “Server” will take effect immediately without saving. However, changes are not saved permanently to the solid state storage until the “Save” button is clicked. Unsaved farm/server settings will be lost during power outage or WebMux™ reboot.

#### Download/Upload

This button will allow you to save and restore the WebMux™ configuration to and from their management workstation. See later chapter for details.

#### Setup

This button brings up the “Administration Setup” page. “superuser” login is required to access this page. See related section for details.

#### Show Event

This button will display all the events since the WebMux’s last reboot. The event includes server failure or state change.

#### Logout

It is not recommended to leave the management browser logged in unattended. Click the Logout button to close the session. The “Login” screen will re-appear.

#### Pause/ Resume

The status screen automatically refreshes frequently to provide most up to date status. You can use the Pause button to freeze the auto refresh.

After clicking the Pause button, the button will change to Resume and the auto refresh will stop. Click the Resume button to restart the auto refresh.

## Adjusting Timeout for Each Service

Clicking on the service type (under the service column) for the farm will allow you to change the timeout value of layer 7 testing for each **different** service. Please note this change is global and will affect all the farms using the same type of service. For example, the default timeout to check the HTTP protocol is 5 seconds. If the web server does not respond to the WebMux™ protocol chat within 5 seconds, the WebMux™ will declare that server is dead and switch that server out from service and notify the operator through email or pager. (Note: WebMux will declare a server dead only if it fails the health check 3 consecutive times). If your web server is not really dead but for some reason is not responding to the checking request within the given timeout, the WebMux™ will false alarm. To avoid this, the user can change the timeout value to a larger value. Many times, servers cannot resolve the IP address of WebMux™ server LAN interface and could cause the server to not respond to the WebMux’s protocol checking. Adding the WebMux™ server LAN IP address and server LAN gateway address to the name resolution table will help resolve this problem. Please read the Q&A section for more information.

## Administration Setup

After logging into management console as superuser, click on the setup button. You will come to this screen:

Please enter information below. Use ":" as divider for multiple entries, except use "," as divider for IPv6 addresses. Multiple entries are not allowed for the server gateway, control ports, mail server, or warning threshold. The items with \* take effect on next restart.

allowed remote host IPs	<input type="text"/>
allowed remote host IPv6 IPs	<input type="text"/>
* TACACS+ server configuration	<input type="text"/>
dialout prefix (blank if none)	<input type="text"/>
pager phone numbers	<input type="text"/>
email server IP address for notification	<input type="text"/>
email addresses for notification	<input type="text"/>
UDP syslog server IP address for notification	<input type="text"/>
* server gateway IP address	192.168.11.1
* WebMux http control port	24
* WebMux https control port	35
* WebMux SNMP UDP port	161
* WebMux diagnostic ports	77:87
connection warning threshold	0
* least significant bits in client IP address to ignore for persistent connections	0 (specific IP address) ▾
ICMP packet input policy	accept ▾
* act as IP router	no ▾
front network verification	TCP connection ▾
front network verification address	<input type="text"/>
send gratuitous ARP replies for farms	yes ▾
* persistence timeout	10 min ▾
connection timeout	15 min ▾
URL for custom service check	/cgi-bin/custom
TCP port for custom service check	80
UDP NTP time server IP address	164.67.62.194
reset stranded TCP connections	yes ▾

Done

### Allowed remote host IPs:

The WebMux™ management console and diagnostic login only allow logins from these IP addresses to establish a management session. You can access from more than one IP address by specifying all the allowed IP addresses separated by a ":" (except use "," as divider for IPv6 addresses). You can put the netmask following the IP address to specify the range of hosts that can access the management console. For example, 192.168.12.0/24 will allow all hosts in 192.168.12 network to access it. From version 6.4.00, 192.168.12 will be allowed for class C allowed host. If this field is left blank, you can access the management software from any IP address. It is recommended to set this up for security reasons. If the wrong IP addresses are entered, management console

login might not be possible. Use the setup mode on the LCD panel to clear the allowed host list. This field is blank by default.

**IPv6 96-bit Address Prefix:**

In Out-of-Path mode, you will see the option to create an IPv6 address prefix. The IPv4 addresses will be appended to this prefix. For example, if you assigned 192.168.12.21 for the WebMux's server LAN ip and you assigned fec0:: as the IPv6 prefix, the WebMux's complete IPv6 address will be fec0::192.168.12.21 (or fec0::c0a8:c15). See also Appendix 8 for extra info on using IPv6.

**TACACS+ Server Configuration:**

The WebMux™ allows you to control the user/passwords for the "superuser" group logins with a TACACS+ server so that password changes can be administered to several WebMux™ machines instantly through a central authentication server. In this field you will need to specify the TACACS+ server IP with "server=xxx.xxx.xxx.xxx". Other arguments include "secret=" (if the TACACS+ server requires a password to be accessed) and "encrypt". Each argument must be separated with a space. If for some reason the TACACS+ server is not working, the WebMux™ will default back to the passwords configured in its password setup screen.

**Dialout prefix:**

Some phone systems require a prefix for outside phone numbers. If a prefix is required, enter it here. Leave it blank if a prefix is not required. For most Analog PBX, this will be "9". Do not enter anything in here, if modem is not connected.

**Pager phone numbers:**

This is the pager phone number to be dialed when an abnormal condition occurs. Enter the number without any special characters or spaces. It should be in the format of a single long integer. Add 1 and the area code if needed. Do not use "(" or "-" or blank spaces. Do not enter anything in here, if modem is not connected.

**Server for email notification:**

In addition to paging, the WebMux™ can send email notifications. Enter the IP address of the email server that will forward the notifications. Please note: Because the WebMux™ does not resolve names, this entry must be an IP address. Changes to the email server allowing the WebMux™ to relay messages are necessary.

**Addresses for email notification:**

Enter the email addresses to be notified. Separate multiple addresses with a colon. For example: johndoe@anywhere.com;janedoe@anywhere.com

**UDP syslog server IP address notification:**

The WebMux™ can be configured to send syslog messages to a remote syslogd server. Enter the syslogd server IP address to use this feature. The syslogd server must be configured to accept remote UDP syslog connections. The facility for WebMux™ syslog messages is LOCAL6.

The notification levels of the syslog messages are as follows:

Level	Search Key	Description
INFO	STATS	LCD display messages
NOTICE	LOGIN	Successful browser login/logout (excludes timeout logout)
NOTICE	SETUP	Significant access and changes to setup and configuration items.
NOTICE	EVENT	Same as pager/mail messages
WARNING	LOGIN	Unsuccessful browser login

Server gateway IP address:

The WebMux™ appears to all the servers in the farms as a gateway or router. This is the IP address for the WebMux™ acting as a router for the servers. This is the IP address that should be used as the default gateway IP address in the web (or other) servers. It is highly recommend adding it to the /etc/hosts file on your servers. Only apply for the NAT mode (or for Out-of-Path mode that requires the WebMux™ to do the SSL termination or Layer 7 load balancing. Normally, this is optional for Out-of-Path mode).

PLEASE NOTE: For first time setup, it is very important to set up this address and the Server Farm network mask (below) first. Also when setting up the servers, you may be asked to fill in the default gateway IP address for the server. Use this IP address to setup all the servers under it. The WebMux™ will not function properly if this IP address is not set correctly for both WebMux™ and the servers.

WebMux™ http control port:

Since the WebMux™ is load balancing incoming HTTP traffic, the HTTP port for the management console must be set to a different port. By default, the port is 24. You can change the port to any port that is not being load balanced, if so desired. The front push buttons can also change this.

WebMux™ https control port:

Since the WebMux™ is load balancing incoming HTTPS traffic, the HTTPS port for the management console must be set to a different port. By default, the port is 35. You can change the port to any port that is not being load balanced, if so desired. The front push buttons can also change this.

SNMP UDP Port:

SNMP on the WebMux is active and uses port 161 by default. You can change the port here. Or you can enter “0” or “none” or leave blank to disable SNMP altogether. WebMux uses SNMP v1 and the community string “public”.

**WebMux™ diagnostic ports:**

The WebMux™ allows diagnostic sessions from remote access for factory technical support or trained network engineers through ssh or telnet. Access is also subject to the restriction of the “Allowed-Host” setting earlier. “superuser” can login with its password using “ssh” to run certain diagnostic tools (help shows the commands, how to use these commands are not supported). When this entry is blank, any diagnostic access is denied. This entry should remain blank under normal operations. Default port numbers are 77 / 87. The first port is ssh and second is telnet. If only one port specified, only ssh login is possible. You will need to notify us the port numbers before obtaining support from us.

**Connection warning threshold:**

The WebMux™ monitors the number of connections established. When the number of connections is greater than the value entered, the WebMux™ will page the designated numbers. For example, if a DoS attack is occurring, the number of connections to the site would be extremely high. Assuming they exceeded the value set for the “connection warning” threshold, the designated numbers would be paged.

**Least significant bits in client IP address to ignore for persistent connections:**

This feature allows persistent connections to be handled properly when communicating with America Online’s bank of cache servers. With AOL’s cache servers, the IP address of the cache server becomes the source address. Since an end user can be sent through multiple cache servers; it is possible the requests for one HTML page are being routed to different web servers in the same session. Therefore, applications, such as shopping carts, that require persistent and secure connections will not work properly. This feature will treat multiple cache servers as one source, thus the WebMux™ can properly handle the persistent requests from browsers. From customers’ feedback, number three (3) is good enough for most AOL requests.

The WebMux™ will use this entry to determine how to load-balance the traffic. It calculates based on two to the power of the entry as the number of IP addresses to combine. When too large a mask applied, it will defeat the load balancing function of the WebMux™.

**ICMP Packet input policy:**

**Accept:** The WebMux™ will allow all ICMP packets to travel through the WebMux™. For CLI arp commands working properly, this must be accept.

**Deny:** The WebMux™ will NOT allow any ICMP packets to travel through the WebMux™.

NOTE: During installation, having the ability to PING the other hosts on the networks is typically useful. When the installation is complete, setting the “ICMP packet policy” to DENY, is recommended as a security precaution.

**Forward Policy:**

Accept: The WebMux™ will route IP packets both directions. The WebMux™ will not act as a firewall in this mode.

Deny: The WebMux™ will NOT allow any incoming IP packet traveling through the WebMux™, except IP packets in farm IP/port. This is the default setting.

**Front Network Verification:**

The WebMux checks the availability of the front network by checking on the IP address you configured as your “external gateway ip” (your router IP). The selection here determines the protocol used to check the connectivity of that IP address. It can be “none”, “ARP”, “TCP Connection”, or “ping”. Depending on the front end router, this can be changed. For example, most Cisco routers will talk to the WebMux™ through ARP and TCP Connection; however, most Cisco DSL modems will only talk to the WebMux™ through Ping. Changes to this verification method will take effect after the WebMux™ has been rebooted. If you have configured a farm on the WebMux and the farm IP itself is showing dead, please verify that your router responds to the method you have specified in this field.

**Front Network Verification IP Address:**

You can specify a different IP address for the WebMux™ to use to check the front network. It can be the router in front of the WebMux™, or a router in your ISP’s WAN. It can be any address that is reachable on your Internet side. The protocol specified in the above field is used. If you see the farm IP turning red, it is an indication that this address failed the check. Leaving this field blank will cause the WebMux™ to use the IP address you specified as the “external gateway ip” when you first set up the WebMux.

**Persistence Timeout:**

The WebMux™ will keep track the clients’ browser connections if the persistent farm is defined and accessed. Within the timeout time period, the WebMux™ will send any request from the browser IP address to the same server. Our survey shows 5-6 minutes is the best value for most cases. The larger the persistence timeout value, the less chance user connection get lost. However, by keeping a lot of connections in the WebMux™ memory, the maximum number of available connections for new clients will drop.

**Connection Timeout (Outbound):**

The WebMux™ keeps track the outbound connections. This outbound proxy function provides communication tunnels for servers behind it to talk to other computers on the Internet side. This type of connection is different from the connections from outside through server farms to the servers. After the

connection closed from the servers to the outside computer, it will wait this timeout minutes before it removes that from the tracking table. Setting this too long will cause the WebMux™ to allocate too much memory, thus reduce the memory for other functions. The default value is 15 minutes. This function has no effect in Out-of-Path mode.

#### URL for Custom Service Check:

Sometimes the WebMux™ built-in server health check is not enough for special needs. When a ASP/JSP server's output depends on the database server and the database server connection is down, one might want to reduce the incoming traffic to the server, suspend new traffic to the server, or totally redirect incoming traffic to a different server. To accomplish that, the WebMux™ allows a farm set up using "custom defined service". It will then call the CGI's URL on the server defined in this field. This will involve a custom developed CGI code by your software developer on your server and place it on the path. Upon success the page should return HTTP response code 200 and a **plain text** page beginning with one of the allowed responses. The URL is truncated to 255 bytes (to be a string of at most 256 bytes with a terminating null). The response from the server must fit in 4k, including all non-display tag and headers etc. This custom CGI code must complete within 15 seconds or the server is considered dead. The custom defined service also allows for CGI code responses that allow the server to change its own weight and announce such change to a remote syslog daemon. Please see Appendix 5 for a sample code and a list of allowed responses.

#### TCP Port for Custom Service Check:

By default, the WebMux will do its custom service check on port 80 no matter what port you set up for the farm. If you wish to change this, you can specify a port here. This is a global setting and will be used for all farms using the custom health check service.

#### UDP NTP Time Server IP Address:

Since version 5.4, the WebMux™ can sync its internal clock with any UDP NTP server. By default it points to a tier 2 NTP server. You can also set it to your Internet NTP server, or wipe out the entry to not sync to any NTP server.

#### Reset Stranded TCP Connections:

When a server failed to function, there could be many TCP connections still in TCP\_WAIT state. If this set to "Yes", when client tries to access the failed server, the WebMux™ will pretend the server is sending TCP Reset to the client, thus freeing all the TCP\_WAIT state connections. Default setting is "Yes" to conserve resources.

#### Reboot:

Changes to "TACACS+ server configuration", "server gateway address", "server farm network mask", "WebMux™ http control port", "WebMux™ https control port", "WebMux SNMP UDP Port", "WebMux diagnostic ports", "least significant

bits”, “forwarding policy”, “front network verification”, and “persistence timeout” requires a reboot for the new configuration to take effect. You can use the Reboot button to reboot the WebMux™ remotely. Reboot button will require confirmation before proceeding with reboot.

## Change Password

**Name:**

Select the login name for which the password is to be changed.

**New Password:**

Enter the new password. This is the password to which the login will be changed.

**New Password Again:**

Enter the same password as in the previous box.

**Confirm/Cancel:**

Click Confirm to execute the change. Click Cancel to return to the previous screen WITHOUT changing the password.

## Change PIN

To protect the WebMux™ from unauthorized changes from the front LCD panel, a PIN can be entered here to prevent saving any changes from the front LCD panel. By default, there is no PIN.

## Set Clock

Click this button to go to the “Set the Clock” page. The time and date of the WebMux™ can then be set. Please note that the WebMux™ internally uses GMT time zone, not your local time zone, per W3C/HTTP protocol. If the time zone is not set correctly, the browser access could be denied due to “cookie” time out. If the UDP NTP server is set up correctly, there is no need to set the clock anymore, since the WebMux™ automatically sets its clock periodically.

month (1-12)	<input type="text" value="10"/>
day of the month	<input type="text" value="30"/>
year, e.g. 2000	<input type="text" value="2001"/>
hour (0-23)	<input type="text" value="16"/>
minute (0-59)	<input type="text" value="56"/>
time zone	<input type="text" value="-07:00 MST/PDT"/>

© 1997-2001 CAI Networks. All rights reserved.

**Month:**

Enter the number of the month, 1 through 12. Leading zeroes are not necessary.

**Day of the Month:**

Enter the day of the month, 1 through 31.

**Year:**

Enter the year. Enter all 4 digits.

**Hour:**

Enter the hour of the day. Use the 24 hour clock, or military time.

**Minute:**

Enter the minute of the hour.

**Time Zone:**

Select the time or hour offset to the UTC (GMT) time. You can set the WebMux™ to your local time, if your time zone is selected here.

**Confirm/Cancel:**

Click Confirm to execute the date and time change. Click Cancel to return to the previous screen WITHOUT making any date or time changes.

**NOTE:** It is recommended to set the WebMux™ clock to UTC (GMT) time.

## Add Farm

Back at the “status screen” of the Main Management console, click “Add Farm” to add a virtual site for the services you want to provide. The “add farm” screen will appear:

### add farm

The services tcp, udp and ip (both of tcp and udp) are generic. Bad server detection is less rigorous for such services. A blank port number (default) means to use the default well-known port for the specified service. For the generic services, a port number of 0, \*, or all denotes the wild specification of all ports. The wild port specification is not allowed for other services.

IP address	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
label	<input type="text"/>		port number	<input type="text"/>

block non-SSL access to farm	NO ▼			
tag SSL-terminated HTTP requests	NO ▼			
compress HTTP traffic	NO ▼			

**Confirm** **Cancel**

© 1997-2008 CAI Networks. All rights reserved.

### Farm IP address:

This is the IP address of the new farm.

For SSL terminated traffic, each farm must have its own IP address.

The farm address could be the Internet known address or the address has been translated by your firewall. For example, if you want to create an http farm for www.mydomain.com, the farm IP address will be the IP address for www.mydomain.com from your DNS record. If the IP address of www.mydomain.com is 205.188.166.10, then the Farm IP address is also

205.188.166.10. The WebMux™ will then translate the farm address to the web server address in your DMZ or internal network.

#### Label:

Since version 4.0.3, we introduced the “label” concept for the farms and servers. Once the label is specified, the WebMux™ will display the label for the farm on the column to the left of the corresponding IP addresses in the status screen. Although labels can be anything, it is better to have meaningful and unique label for each farm. Since version 5.6, the label field is also used as the host name in “HOST:” MIME header to when checking HTTP servers. The “HOST:” MIME header is essential in virtual hosting as that will determine which site is being accessed. The format of the farm label should be the site host name (i.e. [www.xyz.com](http://www.xyz.com)), max length 75 bytes. Without a label specified, a 401 (Unauthorized) error code is still considered a live server. If you have a label specified and the server returns error code 401, then the WebMux™ will consider that server dead. For both IIS and Apache servers doing virtual hosting, the farm name label must be an existing web site name on the server. For more information on Virtual hosting, please go to Appendix 4 for details.

In NAT mode, if you use the WebMux™ for your intranet, the farm IP address will be the original IP address of the web or application server. The web or application server must have its IP address in the address range of the Server LAN subnet. The WebMux™ will translate farm IP address to the server IP address. You can use the IP address used as the Route LAN IP of WebMux™ as your farm addresses to save an IP address. You can create more farms with the same IP address, as long as the port number is different.

In the NAT mode, the WebMux™ also acts as a firewall. All ports except the farm port(s) are blocked. All servers behind the WebMux™ will still be able to reach to the outside through the WebMux™. Traffic from the servers to the outside network will be seen as coming from the WebMux™’s Router LAN IP address, or proxy address. If a WebMux™ is placed behind a firewall, be sure to allow the WebMux Router LAN IP address to get to anywhere/anyport. All farm IP addresses should have rules to allow incoming traffic mapped to the address and port number, as well as the return traffic for each farm IP address from any port to anywhere.

In Transparent (TM or bridge) mode, there is no firewall protection from the WebMux™. All servers talk to each other freely across the WebMux™. Load balancing occurs when the farm IP is accessed.

In Out-of-Path mode, only the Server LAN port is connected, and the farm(s) must use a different IP address than the WebMux™ Server LAN IP address. You can reuse an IP address for more than one farm as long as the port number is different from each other. In this mode, each server must add a loopback adapter. In a Windows server, the route for the loopback adapter must

be removed. Please refer to Appendix 1 and 2 for more detailed procedures. The WebMux™ has been tested extensively working with all versions of Windows, Linux and HP-UX 11.X under this mode. Other OS should also work fine.

**CAUTION:** Once a new farm is added, the IP address of the farm cannot be changed. To correct the IP address, the farm has to be deleted and a new one created.

**Port:**

This is the port number for the farm. If you are choosing one of the known services (see below), you do not have to specify anything in this field. However, if the service you choose is not listed in the list below, you will need to specify a port number here. For example, for MS Terminal Services, use port number 3389. If you enable SSL termination (see “Enabling SSL Termination” section), then specify port 80 for the farm and servers in the farm (choosing “HTTP – hypertext transfer protocol will automatically specify port 80 for the farm). The WebMux™ will terminate all SSL traffic on port 443 and send them to port 80(DO NOT specify port 443 if you enable SSL termination).

**Service:**

The service selection determines the type of service running on the servers in the farm and how the WebMux™ will check the server health status. The service type selection will create a farm using the well-known port for that service type. If a port other than a well-known port for TCP or UDP service is to be used, then choose one of the “Generic” selections and enter the port number in the PORT NUMBER field. You do will not need to specify the port number if the service protocol is on the list. The WebMux™ has level 7 protocol checks for the known ports in the list. For Custom Defined TCP Service (custom health check), please specify the URL for the CGI code in the Administration Setup screen.

**CAUTION:** Once a farm is created, the port number cannot be changed. Like the IP address, the farm must be deleted and a new one created in order to change farm settings.

Please choose “Generic TCP” and specify port number, if service is not listed below. If multiple ports to be used, please also select “Generic TCP” and specify port number “0”.

Service	Well-Known Port#
DNS – Domain Name Service (TCP)	53
FTP – File Transfer Protocol (TCP)	21
HTTP – Hypertext Transfer Protocol (TCP)	80
HTTPS – Secure Hypertext Transfer Protocol (TCP)	443
HTTP/HTTPS Combined Ports	80/443
NTP – Network Time Protocol	123
POP3 – Post Office Protocol	110

Generic no health check (TCP)	User Specify
Generic no health check (UDP)	User Specify
Generic no health check (TCP/UDP)	User Specify
Custom Defined TCP Services	80
Custom Defined UDP Services	User Specify
Custom Defined TCP/UDP Services	User Specify
Custom Defined Paired HTTP and HTTPS (TCP) Service	User Specify

### Scheduling method:

The scheduling method is the way in which traffic is distributed among the servers in the farm. Eight different methods are supported. If you are using a shopping cart service, a persistent scheduling method is recommended.

- Least connections
- Least connections - persistent
- Round robin
- Round robin - persistent
- Weighted least connections
- Weighted least connections - persistent
- Weighted round robin
- Weighted round robin – persistent
- Weighted fastest response
- Weighted fastest response – persistent
- Faster Layer 7 HTTP URI load directing (no compression)
- Layer 7 HTTP URI load directing
- Layer 7 HTTP URL load directing with cookies
- Layer 7 HTTP cookie load directing with cookies

Layer 7 scheduling methods can only be used with the HTTP – Hypertext Transfer Protocol (TCP) service. These scheduling methods allow you to direct traffic to a specific group of servers depending on a match pattern that is compared to the URI in the client’s GET request header.

Layer 7 HTTP URI load directing is your basic Layer 7 load balancing method. The “Faster Layer 7 HTTP URI load directing (no compression)” option is the original basic Layer 7 load balancing feature that was not built with the HTTP compression logic. Although, both selections will load balance exactly the same way, selecting the “Faster” method may free up more resources than the normal Layer 7 HTTP URL load directing option; even if HTTP compression is not being used.

Layer 7 HTTP URL load directing with cookies allows the WebMux™ to maintain client/server persistence. This scheduling method also compares the match pattern against the host MIME header. In other words, a host name can be specified as a match pattern. In order for client/server persistence to occur, the server will have to generate a cookie first. The WebMux™ will generate its own cookie to keep track of which client session belongs to which server. These are useful for shopping cart services, for example, so that a client will be directed to the same server and keep their shopping cart items valid. The WebMux™'s cookie expire time matches the MAX\_AGE setting specified in the cookie generated by the servers. When MAX\_AGE is not defined, the cookie expire time is 30 minutes. If the server deletes the original cookie, the WebMux™ will also delete its corresponding cookie.

Layer 7 HTTP cookie load directing with cookies performs the same way, except that the cookie string contents are also tested against the match pattern.

### SSL Termination:

Selecting an SSL key in this section will enable SSL termination for this farm.

The HTTP service and POP3 service terminate to ports 443 and 995, respectively, and will allow you to choose any port for the clear traffic to the servers.

When using the generic or custom services, specifying the clear traffic port for the service in the “port number” section causes the WebMux™ to automatically assume the secure port for the following services:

Clear Traffic Port	Secure Port	Service
80	443	HTTP
110	995	POP3
23	992	Telnet
25	465	SMTP
119	563	NNTP
143	993	IMAP
194	994	IRC
389	636	LDAP

### Compress HTTP Traffic:

Selecting “yes” to this option will activate the WebMux™ HTTP compression. If the client web browser sends out a MIME header that states that it accepts compressed data. The WebMux™ will compress HTTP data to the client browser. If the WebMux™ detects that the servers in the farm are already compressing the data, the WebMux™ will not perform compression. Instead, it will let the compressed data from the servers pass through without additional processing. When enabled the MIME header "X-WebMux-Compression: true" will be appended to the server response MIME header. The WebMux will also automatically disable compression should its CPU usage reach 50%. **Please note: compression is NOT supported in Out-of-Path Mode, except when used in a Layer 7 Farm.**

## Enabling SSL Termination

By default, the SSL termination is NOT on. The following description is about enabling SSL termination for an HTTP farm.

### add farm

The services tcp, udp and ip (both of tcp and udp) are generic. Bad server detection is less rigorous for such services. A blank port number (default) means to use the default well-known port for the specified service. For the generic services, a port number of 0, \*, or all denotes the wild specification of all ports. The wild port specification is not allowed for other services.

IP address	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
label	<input type="text"/>		port number	<input type="text"/>
service	HTTP -- hypertext transfer protocol (TCP) ▼			
scheduling method	weighted round robin - persistent ▼			
SSL termination	(none) ▼	SSL port	<input type="text"/>	
block non-SSL access to farm	NO ▼			
tag SSL-terminated HTTP requests	NO ▼			
compress HTTP traffic	NO ▼			

Confirm

Cancel

© 1997-2008 CAI Networks. All rights reserved.

In the “Add Farm” screen, select “HTTP – hypertext transfer protocol (TCP)” in the “service” section. In the “SSL Termination” section, choose from any key other than “none” (see the SSL Keys section about importing your SSL keys). This will enable SSL termination on the HTTP farm. All the HTTPS incoming traffic will be sent terminated to farms on HTTP port (80). Please set the “port number” to a clear port, since after the WebMux™ terminates the SSL traffic, only clear traffic will go to servers. When the servers return traffic back, the WebMux™ will re-encrypt the data and send encrypted back to client. If you are using out-of-path mode, please make sure your servers’ gateway points to the

WebMux™ server LAN gateway IP address (not the router); so that the WebMux™ has the chance to re-encrypt the data before replying back to clients.

#### Block non-SSL access to farm:

One can also block non-encrypted incoming traffic, so that only encrypted traffic can reach your server. This might be useful, when you only want encrypted traffic to reach your servers.

#### Tag SSL-terminated HTTP requests:

Because traffic between the WebMux™ to your servers is unencrypted traffic, your servers will not be able to tell if the originating connection was HTTPS or HTTP. This may be important if the application on the server requires that kind of information. You can turn on “tag SSL-terminated HTTP requests”. By selecting “Yes”, the decrypted traffic to the servers will have the added MIME header “X-WebMux-SSL-termination: true”. It is up to you how you want the server to process this information. For example, you can write a script on your server to identify if the original traffic was HTTPS or HTTP, and then properly redirect the traffic to the HTTPS.

The WebMux™ allows SSL termination from any port to the farm port. If your SSL/TLS traffic is other than the standard HTTPS traffic, you may want to specify the SSL traffic port in the “SSL port” field. The WebMux™ will listen to that SSL port, terminate the encrypted traffic from that port into the farm port, and re-encrypt the return traffic from the server to the clients.

## SSL Keys

SSL termination management

Click on its link to manage a key.

key	farms	
<a href="#">key 1</a>	1	sample 1024 bit RSA private key
<a href="#">key 2</a>	0	sample 2048 bit RSA private key
<a href="#">key 3</a>	0	(key and certificate unset)
<a href="#">key 4</a>	0	(key and certificate unset)
<a href="#">key 5</a>	0	(key and certificate unset)
<a href="#">key 6</a>	0	(key and certificate unset)
<a href="#">key 7</a>	0	(key and certificate unset)
<a href="#">key 8</a>	0	(key and certificate unset)
<a href="#">key 9</a>	0	(key and certificate unset)
<a href="#">key 10</a>	0	(key and certificate unset)

<a href="#">key 16</a>	0	(key and certificate unset)

Back

© 1997-2005 CAI Networks. All rights reserved.

The WebMux™ supports SSL V2, SSL V3, and TLS V1 with RSA key length from 512, 1024, and 2048. For each WebMux™, one can have 32 SSL certificates: Any key can be active or not active. The first line of the private key is the comment. See included two sample keys for details. If there is no comment line in the key, it will be blank. If there is no key, it will display “(key and certificate unset)”.

Key length can be from 512 to 2048. RSA key length 1024 is also called 128bit strong encryption.

At the bottom of the screen you will see the option to choose encryption protocols allowed:

This will enable you to restrict SSL connections that do not follow the minimum protocol. If there are already active farms using SSL Termination, then changing this setting will require you to reboot the WebMux™ to activate changes. If you decide not to reboot, existing farms will run under the previous criteria and new farms will follow the new criteria. Rebooting the WebMux will ensure that ALL the farms with SSL Termination will adhere to the new protocol requirement.

You can click “manage key1” or “manage key2” to generate keys, copy and paste signed certificates:

You can view, copy and paste keys into the two windows. You should backup your private key and save in a secure place. Each private key and public key pair must match to be able to work properly.

If you plan to generate new keys, click on the drop down box above the private key window to select the “use newly generated” item with the desired key length,

and then click on the “Confirm” button. This process is also known as “generating a CSR” – Certificate Signing Request. It is the process where you generated a key pair and send the public key to the CA for “signing”. Once your public key signed and pasted into the key management screen, all the browsers over Internet will accept it without complaint during the lifetime assigned to the key. You can visit [www.thawte.com](http://www.thawte.com) or [www.verisign.com](http://www.verisign.com) for more information.

The screenshot shows a web browser window titled "SSL private key and certificate request generation - Microsoft Internet Explorer". The address bar shows the URL: `http://192.168.12.22:24/cgi-bin/ssl?sp=131073&bits=1024&ssl=1&se`. The page header includes the WebMux logo and text: "High Availability Solution built-in scalability webservers-loadbalancer" and "CAI Networks, Inc". The main heading is "SSL private key and certificate request generation". Below the heading is a paragraph: "Please enter information to make new private key 1 and its matching certificate request. If you do not fill in all fields, the certificate authority may reject your certificate request." The form contains the following fields:

country (C) (2 bytes)	<input type="text"/>
state, province, etc. (ST)	<input type="text"/>
city etc. (L)	<input type="text"/>
organization (O)	<input type="text"/>
organization unit (OU)	<input type="text"/>
domain (CN)	<input type="text"/>
email address (emailAddress)	<input type="text"/>

At the bottom of the form are two buttons: "Confirm" and "Cancel". Below the buttons is the copyright notice: "© 1997-2005 CAI Networks. All rights reserved." The browser status bar shows "Done" and "Internet".

Enter all the necessary information. Click on the “Confirm” button to complete the key generation. A certificate request will be generated. **BE SURE TO COPY AND SAVE THIS BEFORE YOU CONTINUE.** When you are done saving the certificate request, you can click on the “Confirm” button. You will be taken back to the dialog boxes that will display the newly created private key. You should make a backup copy of that as well.

Submit the certificate request to the CA of your choice to sign. Once they send you back the signed certificate, you will need to paste that into the certificate dialog box, select “use new certificate pasted in” and click on the “Confirm” button to save it into the WebMux™.

Generally, you will receive three certificates. The one whose identity is your e-mail address is the site certificate. The one whose subject and issue are identical is the CA root. The third one is called the intermediate certificate. Please paste your site certificate first, followed by your intermediate certificate.

SSL key 2 management

This key and certificate chain are not currently used for SSL termination. You may change this key or certificate chain using the dropdown menus. You may either let WebMux generate a new key or paste in a new private key. You may paste in a new certificate chain. If you wish to let WebMux generate a new private key, please select the key length from the dropdown menu. You may not use a new key until you have pasted in a matching signed certificate chain. You may paste a new certificate chain any time before the key is put into use.

Some certification authorities issue a certificate chain consisting of a single certificate. Some certification authorities issue a chain consisting of multiple certificates. Often the certificate chain consists of a server certificate and an intermediate certificate. In this case the server certificate should come first, and then the intermediate certificate. (The root certificate for the certification authority itself need not be included.)

If you have existing signed keys from a Windows IIS server or a Linux server, you can transfer them into the WebMux™ and continue using them until they expire. You should be able to directly transfer your existing key and certificate

from your Linux server. For Windows IIS keys and certificates, you will need to convert them to PEM format.

Please refer to our support site for instructions:

<http://www.cainetworks.com/support/how-to-convert-ssl.html>

You can get OpenSSL for Windows at:

<http://www.slproweb.com/products/Win32OpenSSL.html>

If you would rather, you may contact us at [support@cainetworks.com](mailto:support@cainetworks.com) and we can do the conversion for you.

## Upload/Download (Backup/Restore)

### Download:

This feature allows the SAVED (not necessarily the active) configuration to be saved at the Administrative Browser workstation. Click on the **Click Here** to display the configuration. Choose 'File->Save As' from the browser menu to save it as a text file. Changes can be made to this file and uploaded to the WebMux™. DO NOT change the first comment line.

### Upload:

Upload allows a configuration file that has been saved at the browser workstation to be uploaded to the WebMux™. Enter the full path of the configuration file, or click on **Browse** to search for the file. Click **Upload** to upload the file to the WebMux™. This file will IMMEDIATELY become the saved and active configuration. Upload ALL Settings to WebMux™ will actually upload settings including IP addresses, farms, and information you entered in the Administration Setup. If you want to replace the WebMux™ with a new unit, you could save the configuration and upload all settings to the WebMux™, so that you do not need to go through step by step configuration (requires both WebMuxes on the same firmware revision).

## Modify Farm

Modify farm can be invoked from the main management console screen by clicking on the farm IP address.

**modify farm 192.168.12.30 port 80**

(SSL termination not active)  
(no HTTP compression)

label	<input type="text"/>
scheduling method	weighted round robin - persistent <input type="button" value="v"/>
SSL termination	(none) <input type="button" value="v"/> SSL port <input type="text" value="443"/>
block non-SSL access to farm via 192.168.12.30:80	NO <input type="button" value="v"/>
tag SSL-terminated HTTP requests	NO <input type="button" value="v"/>
compress HTTP traffic	NO <input type="button" value="v"/>

© 1997-2008 CAI Networks. All rights reserved.

### Farm IP address and port number:

This displays the current farm IP that is being modified. These fields are set in the "Add Farm" screen. Once set, they are not changeable. If they must be changed, delete the farm and then add a new one.

### Label:

The label is displayed on the column to the left of the corresponding IP addresses in the main status screen. Although labels can be anything, it is better to have meaningful and unique label for each farm. The label field is also used as the host name in "HOST:" MIME header to when checking HTTP servers. The "HOST:" MIME header is essential in virtual hosting as that will determine which site is being accessed. The format of the farm label should be the site host name (i.e. [www.xyz.com](http://www.xyz.com)), max length 75 bytes. Without a label specified, a 401 (Unauthorized) error code is still considered a live server. If you have a label specified and the server returns error code 401, then the WebMux™ will consider

that server dead. For both IIS and Apache servers doing virtual hosting, the farm name label must be an existing web site name on the server. For more information on Virtual hosting, please go to Appendix 4 for details.

#### Farm scheduling method:

Eight different methods are supported:

- Least connections
- Least connections - persistent
- Round robin
- Round robin - persistent
- Weighted least connections
- Weighted least connections - persistent
- Weighted round robin
- Weighted round robin – persistent
- Weighted fastest response
- Weighted fastest response – persistent
- Faster Layer 7 HTTP URI load directing (no compression)
- Layer 7 HTTP URI load directing
- Layer 7 HTTP URL load directing with cookies
- Layer 7 HTTP cookie load directing with cookies

#### SSL Termination:

You can change the SSL certification/key pair used for this farm. All current connections for this farm will be reset if the key changes.

#### Block non-SSL Access to farm:

If you do not want to allow non-encrypted traffic going to server, select “Yes”.

#### Tag SSL-terminated HTTP requests:

If SSL termination is active for this farm, choosing “Yes” for this option will add an “X-WebMux-SSL-termination: true” MIME header in the decrypted http request.

#### Compress HTTP traffic:

Enable or disable HTTP compression. When enabled the MIME header "X-WebMux-Compression: true" will be appended to the server response MIME header. (NOT supported in Out-of-Path Mode, except when used in a Layer 7 Farm).

#### Delete:

Click this button to delete the entire farm.

<b>CAUTION:</b> This function also deletes <b>ALL</b> the servers under this farm.
--

## Add Server

In the Modify Farm screen click on the “Add Server” button to add a new server to this farm.

IP address	192	168	11	
label			port number	same
weight	1			
run state	FAVORITE ACTIVE			

**Confirm** **Cancel**

© 1997-2005 CAI Networks. All rights reserved.

### Server IP Address:

This is the IP address of the server to be added.

### Label:

Since version 4.0.3, the WebMux™ allows adding a label to each server's IP address. The purpose of labeling a server is only to help identify the server in the farm. It has nothing to do with the name resolution of the server. Although label can be anything, it is always better to have meaningful and unique label for each server.

**CAUTION:** Once the server is added, the IP address cannot be changed. To correct the IP address, the server must be deleted and a new one be created.

### Server Port Number:

If the port number specified in the farm setup is the same as the real server's port number, you can leave this as "same". In NAT mode, the WebMux™ can perform port forwarding from the farm IP port to the server IP port if you specify a server port that is different from the farm port.

**CAUTION:** Like the IP address, once created, the port number cannot be changed. To correct the port number, the server needs to be deleted and a new one to be created.

### Weight:

Scheduling priority weight. Valid integer numbers are between 1 and 100. A server that has a weight of 2 will be directed twice as much traffic as a server with a weight of 1.

A special zero weight setting is provided for a graceful shut down of a server. When the weight is changed to zero, the WebMux™ will not send new connections, but will maintain all current connections to the server. The connections will gradually reduce to zero as current clients' sessions terminated. When there are no connections, the server is functionally "dead" or off line until the weight is changed back to a valid number. Then the server can then be shutdown or taken out of service without affecting any users.

**CAUTION:** Unlike a server that can go down unexpectedly, the WebMux™ will not move a STANDBY server to ACTIVE when one or more server's weight is set to zero. If the weight of all the servers in a farm were set to zero, then the farm would be "down" because none of the servers are accepting new connections.

**NOTE:** If your scheduling method is of the "persistent" type, be aware that the WebMux™ will continue to honor those existing persistent sessions. If you have clients that continue to return before the persistence timeout has expired, then you will continue to see connections coming in.

### Run State

- **Active** - The server will be put into service immediately after it is added. If there are servers in the farm in Standby, WebMux will activate a Standby server in its place if it goes out of service. When the original server comes back in service, it will stay Standby mode until manually setting its run state to Active again through the browser interface. This will give system administrator time to fix the system or reboot the server once some software/hardware update is completed.
- **Favorite Active** – The server will be put into services immediately after it is added. If a Favorite Active server failed, once it is operational, the WebMux™ will automatically put it back to the Active state.
- **Standby** - The server will be put into STANDBY, or backup, mode after it is added. The WebMux™ will change a STANDBY server to ACTIVE when one or more ACTIVE servers fail.

- **Last Resort Standby** – The server will be put into STANDBY state. Unless all other servers are out of services, this server will not be switch in. This will allow the last server to show a different web page from others.

## Add Address/Port

Click this button using MAP™ feature to create additional IP address/port protocol combinations for the farm. The same client will also be sent to the same server no matter which port it accesses within that MAP™.

Help

High Availability Solution  
built-in scalability webserver loadbalancer

**CAI Networks, Inc**

**add IP address/port**

**farm: xxx.xxx.xxx.xxx:xx**

IP address	<input type="text"/>	<input type="text"/>	<input type="text"/>
label	<input type="text"/>	port number	<input type="text"/>
service	FTP -- file transfer protocol (TCP) <span style="float: right;">▼</span>		
SSL termination	(none) <span style="float: right;">▼</span>	SSL port	<input type="text"/>
block non-SSL access to farm	NO <span style="float: right;">▼</span>		
tag SSL-terminated HTTP requests	NO <span style="float: right;">▼</span>		

© 1997-2007 CAI Networks. All rights reserved.

### Farm IP and Port:

This displays the current farm you are modifying. These fields are set in the "Add Farm" screen. Once set, they are not changeable. If they must be changed, delete the farm and then add a new one.

### IP Address:

Add an IP address to the current farm configuration. The IP address can be the same as long as the port number does not duplicate any existing IP/port combinations.

### Label:

The label is displayed on the column to the left of the corresponding IP addresses in the main status screen. Although labels can be anything, it is better

to have meaningful and unique label for each farm. The label field is also used as the host name in “HOST:” MIME header to when checking HTTP servers. The “HOST:” MIME header is essential in virtual hosting as that will determine which site is being accessed. The format of the farm label should be the site host name (i.e. [www.xyz.com](http://www.xyz.com)), max length 75 bytes. Without a label specified, a 401 (Unauthorized) error code is still considered a live server. If you have a label specified and the server returns error code 401, then the WebMux™ will consider that server dead. For both IIS and Apache servers doing virtual hosting, the farm name label must be an existing web site name on the server. For more information on Virtual hosting, please go to Appendix 4 for details.

#### Port Number:

You can specify a port number that doesn't duplicate any existing IP/port combinations. A port number of “all” will enable all port ranges, but excluding any already existing ports associated with the specified IP address. *Please see the note at the end of this section regarding the behaviors of the additional IP/port in conjunction with SSL termination.*

#### Service:

This allows you to specify the type of health checking you want the WebMux™ to perform for this MAP™ instance.

#### SSL termination:

You can enable the WebMux™ to do the SSL termination of this MAP™ instance.

#### SSL port:

The known secure port for the type of service you selected will be automatically filled in. You can manually change it if you are using a different port for that service.

#### Block non-SSL access to farm:

Prohibits non-SSL connection to this MAP™ instance.

#### Tag SSL-terminated HTTP requests:

This will enable the WebMux to add an “X-WebMux-SSL-termination: true” MIME header in the decrypted http request sent to the server.

<p><b>CAUTION:</b> If your farm is already SSL terminated and you create an additional IP/port combination using the main farm IP and specifying the same secure port (or “all”), the SSL termination by the WebMux will be bypassed and SSL will be done directly by the server.</p>
---

## Add L7 Server

If setting up a Layer 7 farm, the add server screen will be similar to this:

adding server - Microsoft Internet Explorer

File Edit View Favorites Tools Help

Back Forward Stop Home Search Favorites Refresh Print Mail Web Services

Address [http://192.168.12.22:24/cgi-bin/add\\_dst?SC0A80C1F00500D0004](http://192.168.12.22:24/cgi-bin/add_dst?SC0A80C1F00500D0004) Go

**WebMux™** High Availability Solution built-in scalability webserver loadbalancer **Help**  
CAI Networks, Inc

**add server**  
farm: 192.168.12.31:80

IP address	192	168	11	
label			port number	same
weight				1
run state				ACTIVE
match pattern	.*			
pattern is anchored				NO

**Confirm** **Cancel**

© 1997-2006 CAI Networks. All rights reserved.

Done Internet

Two options extra options are available:

- Match Pattern
- Pattern is anchored

### Match Pattern:

This is the pattern that will need to match the client request data to access this server. It is in extended regular expression format. Please refer to Appendix 7 for some examples.

### Pattern is Anchored:

This means that the match pattern will be checked against the very beginning of the string following the "http://".

**NOTE:** If you chose Layer 7 URL load directing with cookies or URL cookie load directing with cookies as the scheduling method, the match pattern is also compared to the host MIME header. In other words, you can use a host name as a match pattern criterion.

## Modify Server

Modify Server can be invoked by clicking on the server IP address on the Status screen.

### Destination server IP address and port number:

These parameters are set in the “Add Server” screen. Once set, these fields cannot be modified. To correct this setting, delete the server and add a new one.

### Label:

The label can be changed at any time. The change will not affect how server is performing in the farm; rather it is for description purpose only.

### Weight:

Scheduling priority weight. Valid integer numbers are between 0 and 100. Changing the weight to zero will stop the incoming connections while all existing connections continue until time out or connection is terminated by client and server. Although all numbers from 1 to 100 will allow traffic to go through, using a smaller weight number in each server will have the best load distributing result.

Running state (see the Add Server section for details):

- Active
- Favorite Active
- Standby
- Last Resort Standby

## Activating the Anti-Attack Feature

To get to the Anti-Attack settings of the WebMux™, first log in as “superuser” in the Web Management console. Once logged in, enter this address in your web browser (you may need to click on the “pause” button on the status page to stop the automatic refresh):

<http://webmux.ip.address:24/cgi-bin/sec>

(alternately, you can use https and specify port 35)

You will see this screen:

**TCP connection attack threshold:** This will set the maximum number of concurrent connection a client can make before the WebMux will consider it an attack. You do not want to set this value too low because most of time servers will experience several concurrent connections during normal operations. Usually a DoS or DDoS connection attack comes in by the hundreds. Set this value according to your needs.

**Client Whitelist for TCP attacks:** It may be necessary to allow certain IPs to make connections that may appear to be attacks. For example, if you have a third party company that regularly benchmarks your services for maximum load handling, you will need to allow that company uninterrupted access. You can use a specific IP address or specify a network range (i.e. xxx.xxx.xxx.0/24). Separate each entry with a colon (:).

**Duration to block attackers:** This sets the amount of time to block attacker IP addresses. It may not be desirable to block specific IP addresses indefinitely because of the dynamic nature of IP addresses used by the general public. You may end up blocking out potential customers in the future. Therefore, this setting allows you to set the IP blocking duration that suite your needs.

Changing the settings in this page will not require a reboot and is effective once you click the confirm button.

## Adding Static Routes

You can add static routes to the WebMux™ using the Web GUI or through the Command Line Interface (CLI).

To use the Web GUI, you must already be logged in as “superuser” for the web interface. Then enter the following URL in your web browser:

<http://ip.of.webmux:24/cgi-bin/route>

(Alternately, you can use https and port 35)

You should see this screen:

**WebMux™ High Availability Solution** Help  
 built-in scalability webserver loadbalancer  
**CAI Networks, Inc**

### route management

This screen shows the current routing table and allows its management. The dropdown gives three choices: to change the table by specifying addition or deletion, to save it so that it will be used after reboots or upon restoration requests, or to restore the last previously saved routing table. Changes to the routing table take effect immediately, but they do not persist past reboots unless the table has been subsequently saved. Routes shown in grey may not be deleted.

routing table	make indicated changes ▾		
address	mask	gateway	NIC
192.168.255.252	255.255.255.252	0.0.0.0	eths0
192.168.12.0	255.255.255.0	0.0.0.0	br0
127.0.0.0	255.0.0.0	0.0.0.0	lo
0.0.0.0	0.0.0.0	192.168.12.1	br0

add

**Confirm** **Cancel**

© 1997-2007 CAI Networks. All rights reserved.

Routes displayed that are “grayed out” cannot be modified. To add a route, make sure “make indicated changes” is selected in the drop down menu, click the “add” checkbox, and fill in the remaining fields. Click the “confirm” button. Your new route should appear along with a “delete” checkbox. You can click on

the “delete” checkbox and click confirm to delete the selected route. Please remember that even though a new route is immediately active once you click the “confirm” button, it is not automatically saved and will get lost if the WebMux™ is rebooted or powered off. To save your settings, select “save displayed table” from the drop down menu and click the “confirm” button.

If you made unsaved changes and want to quickly revert back to your previously saved settings, select “restore last saved table” from the drop down menu and click the “confirm” button

To get to the CLI, you can either telnet or ssh in to the WebMux™ diagnostic port. By default it is port 77 for ssh and port 87 for telnet. Login as “superuser”. Issue the “route” command to modify the routing table. The network interfaces are as follows:

ethf0 – Interface labeled “Internet”  
eths0 – Interface labeled “Backup”  
ethb0 – Interface labeled “Server”

Modifications to the routing table issued through the CLI are automatically saved after issuing the command.

---

## Initial Setup Change through Browser

You may want to change the basic settings for the WebMux™ through browser interface, for example, when the WebMux™ located in a hosting center across the country. If one has information about the WebMux™ current basic settings, one could change those parameters through browser. On the browser, enter the following URL:

`https://webmux_ip:webmux_manage_port/cgi-bin/rec`

For example, if your `webmux_ip` is 192.168.12.1, and your `webmux_manage_port` is 24, your URL will be

**`http://192.168.12.1:24/cgi-bin/rec`**

WebMux initialization 8.4.02 . . .  
You are not logged in as superuser.  
Please enter your WebMux superuser's login name:  
  
Please enter your WebMux superuser's password:  
  
current GMT setting:  
17:55:20 05/14/2008  
If incorrect, please enter correct GMT as hh:mm:ss mm/dd/yyyy. (Use 24 hour time, not a.m. or p.m.)  
  
Set time only?  YES  NO

The first screen in “rec” (reconfiguration) asks for the superuser’s password. The default superuser’s password is “superuser”, however, the actual superuser’s password may have been changed by the system administrator. If you could not remember the superuser’s password, someone has to go to the keypad to reset the password. See page 22 for more details.

The next question on the screen asks to set the time in the WebMux™. The WebMux™ uses its clock to set the cookie for the management browser. When a WebMux™ manager is logged in for more than 8 hours without activity, the WebMux™ will log out the user based on the cookie. If the clock is off by more than 8 hours, the manager will not be able to login in to the WebMux™. This section on the “rec” screen will allow the manager to correct the clock if it is off. After entering proper password and setting the clock information (optional), the “continue” button will bring up this screen:

WebMux initialization

WebMux's host name without domain	<input type="text"/>
WebMux's domain name	<input type="text"/>
dispatch method	<input type="text" value="↓"/>
Router LAN gateway IP address	<input type="text"/>
WebMux's router LAN IP address	<input type="text"/>
WebMux's router LAN IP network mask	<input type="text"/>
WebMux's server LAN IP address	<input type="text"/>
WebMux's server LAN network mask	<input type="text"/>
WebMux's router LAN VLAN tag (0 if none)	<input type="text"/>
WebMux's server LAN VLAN tag (0 if none)	<input type="text"/>
Remake password file with default passwords?	<input type="text" value="↓"/>
WebMux administration HTTP port	<input type="text"/>
WebMux administration HTTPS port	<input type="text"/>
Is this WebMux a primary (or solo) WebMux?	<input type="text" value="↓"/>
Is this WebMux running solo without a secondary?	<input type="text" value="↓"/>
Server LAN gateway IP address on WebMux (not same as server LAN IP address above!) (required for NAT, optional for OOP, use 0.0.0.0 to omit)	<input type="text"/>
Reinitialize configuration with admin entries only? (destroys existing configuration!)	<input type="text" value="↓"/>
Reboot immediately after submitting this form?	<input type="text" value="↓"/>
Submit when satisfied or cancel and log out.	<input type="button" value="submit"/> <input type="button" value="cancel"/>

Click the mouse into a field or use the TAB key to move the cursor into a field to see the current values. The user may change it based on new information obtained from ISP or network engineers. Once you press on the submit button, the WebMux™ will save all the changes to its internal solid state storage and reboot itself with the new value.

## Sample Configuration Worksheets

### Standalone WebMux™ NAT Mode

#### Configuration Before WebMux™ Installation

Equipment	IP Address
Internet Router (or Firewall) Address	205.133.156.1
Webserver(s) Default Gateway	205.133.156.1
Web Site IP Address	205.133.156.200

#### Configuration After WebMux™ Installation

Question	Entry
<b>Host Name</b>	webmux
Domain Name	cainetworks.com
NAT, Transparent, or Out-of-Path	NAT
<b>Router LAN Information</b>	
Router LAN WebMux™ Proxy IP Address	205.133.156.200
Router LAN Network IP Address Mask	255.255.255.0
Router LAN VLAN ID (optional)	101
<b>Server LAN Information</b>	
Server LAN WebMux™ IP Address	192.168.199.251
Server LAN Gateway IP Address	192.168.199.1
Server LAN Network IP Address Mask	255.255.255.0
Server LAN VLAN ID (optional)	102
<b>Administration Setup Information</b>	
External Gateway IP address	205.133.156.1
Remake /home/WebMux/conf/passwd	Y
Administration HTTP Port Number	24
Secure Administration HTTPS Port Number	35
Is this WebMux™ primary	Y
WebMux™ running solo without backup	Y
<b>Reboot?</b>	<b>Y</b>

You will also need to change the Web server IP address to 192.168.199.10, and its default gateway to 192.168.199.1. Add a farm for 205.133.156.200 and add a server to the farm at 192.168.199.10. You can then add more servers at 192.168.199.20 and 192.168.199.30. You can also add additional farm at 205.133.156.210, and add above three servers to the 2<sup>nd</sup> farm.

## Standalone WebMux™ Transparent Mode

### Configuration Before WebMux™ Installation

Equipment	IP Address
Internet Router (or Firewall) Address	205.133.156.1
Webserver(s) Default Gateway	205.133.156.1
Web Site IP Address	205.133.156.200

### Configuration After WebMux™ Installation

Question	Entry
<b>Host Name</b>	WebMux
Domain Name	Cainetworks.com
NAT, Transparent, or Out-of-Path	Transparent
<b>Bridge Information</b>	
Bridge IP Address	205.133.156.210
Bridge IP Network Mask	255.255.255.0
WebMux™ farm IP Address	205.133.156.200
(front) Router LAN VLAN ID (optional)	101
(back) Server LAN VLAN ID (optional)	102
<b>Administration Setup Information</b>	
External Gateway IP address	205.133.156.1
Remake /home/WebMux/conf/passwd	Y
Administration HTTP Port Number	24
Secure Administration HTTPS Port Number	35
Is this WebMux™ primary	Y
WebMux™ running solo without backup	Y
<b>Reboot?</b>	<b>Y</b>

## Out of Path Installation of WebMux™

### Configuration Before WebMux™ Installation

Equipment	IP Address
Internet Router (or Firewall) Address	10.1.1.1
Webserver(s) Default Gateway	10.1.1.1
Web Site IP Address	10.1.1.200/255.255.0.0

### Configuration After WebMux™ Installation

Question	Entry
<b>Host Name</b>	webmux
Domain Name	cainetworks.com
NAT, Transparent, or Out-of-Path	Out-of-Path
<b>WebMux™ Server LAN Information</b>	
Server LAN WebMux™ IP Address	10.1.2.254 (any)
Server LAN WebMux™ IP Address Mask	255.255.0.0
Server LAN WebMux™ farm IP Address	10.1.1.200
Server LAN VLAN ID (optional)	102
Server LAN gateway IP address (Necessary for WebMux™ SSL termination and for Layer 7 load balancing. Each server's default gateway needs to be set to this IP)	10.1.1.253
<b>Server Configuration</b>	
Server IP address	No Change
Server NetMask	No Change
Server Default Gateway	No Change
Server Default Gateway (if using WebMux™ for SSL Termination or Layer 7 load balancing)	10.1.1.253
Server add loopback adapter	10.1.1.200
Route Deletion Refer to Appendix 2	10.1.1.200
<b>Administration Setup Information</b>	
WebMux™ External Gateway IP address	10.1.1.1
Remake /home/WebMux/conf/passwd	Y
Administration HTTP Port Number	24
Secure Administration HTTPS Port Number	35
Is this WebMux™ primary	Y
WebMux™ running solo without backup	Y
<b>Reboot?</b>	<b>Y</b>

There is no change to each server's IP address, netmask and gateway address (except if using the WebMux™ for SSL termination or Layer 7 load balancing. See next paragraph). You will need to add a loopback adapter to each server,

and assign the farm address to the loopback adapter. For MS Windows, it always adds a route for the loopback adapter, which will need to be removed, please refer to Appendix 2. In the virtual farm, add each server using its real IP address.

For SSL termination or Layer 7 load balancing, you must set server LAN gateway IP address and set the servers' default gateway to that IP.

If using multiple VLAN configuration, please note the VLAN IP address cannot be used for FARM address. FARM address must be an address within that VLAN and other than the VLAN IP address.

## A Redundant Installation

### Configuration Before WebMux™ Installation

Equipment	IP Address
Internet Router (or Firewall) Address	205.133.156.1
Webserver(s) Default Gateway	205.133.156.1
Web Site IP Address	205.133.156.200

### Configuration Before WebMux™ Installation

Question	Entry	
	Primary	Secondary
<b>Host Name</b>	webmux1	webmux2
Domain Name	Cainetworks.com	Cainetworks.com
NAT, Transparent, or Out-of-Path	NAT	NAT
<b>Router LAN Information</b>		
Router LAN WebMux™ Proxy IP Address	205.133.156.200	205.133.156.200
Router LAN Network IP Address Mask	255.255.255.0	255.255.255.0
Router LAN VLAN ID (optional)	101	101
<b>Server LAN Information</b>		
Server LAN WebMux™ IP Address	10.1.1.10	10.1.1.20
Server LAN Gateway IP Address	10.1.1.1.1

## FAQs

---

- Q. I can't login with my browser. It always says you are not logged in.
- R. To use your browser to manage the WebMux™, it must be set to accept all cookies. Because the cookie is set to expire in 8 hours, you also need to make sure your system clock set correctly using GMT. The message is an indication that your system clock is off. Please refer to page 84 on how to set the system clock of the WebMux™.
- Q. I can't login with my browser because the WebMux™ does not respond.
- R. Your IP address is not on the allowed host list, or the wrong IP addresses were entered by accident. Use the LCD panel setup to clear that list.
- Q. If I have multiple servers assigned as STANDBY, how does the WebMux™ choose which server to use if an ACTIVE server goes down?
- R. The WebMux™ checks the standby servers in order and activates each one until their total weight meets or exceeds the server that is unavailable
- Q. Will a server with weight 0 act as a STANDBY?
- R. No. A weight of 0 indicates that the server will not accept any new connections. The state is considered neither ACTIVE nor STANDBY. This is to quiet the new connections for the server so that it can be taken out of service.
- Q. Is the Server LAN and the Router or Front LAN required to be on separate IP subnets?
- R. It is required that the server LAN and the router LAN be separate IP subnets.
- Q. What notification services are compatible with the WebMux™?
- R. Airtouch and PageMart are the services that are currently supported. Any SMTP server configured to allow relaying from the WebMux™ can be used for sending email notifications.
- Q. If I'm running a Unix-based FTP, such as wuftp, how can I get the ftp server in the farm to resolve the WebMux™ IP addresses?
- R. The IP addresses typically will not be able to be resolved since the servers in the farm are typically using non-routable or private network addresses. In order for wuftp to resolve the IP addresses and stop

complaining, place the non-routable IP address entries in the /etc/hosts file on those servers.

Q. How come my servers in the farm are showing in red color from time to time, even the servers are okay?

R. Your servers are trying to resolve the WebMux's IP address to name so it could log them into log file. To avoid this problem, set the servers not resolve the IP addresses. You can also try adding all the IP address to the /etc/hosts file on your servers. For example,

```
www.mydomain.com 1.2.3.4 // use your real IP address
webmuxgw 192.168.199.1 // server lan gateway
webmuxip 192.168.199.254 // server lan WebMux™
```

Q. How many browsers can simultaneously access the WebMux™ management console?

R. The limit is 4.

Q. I have added a new farm/server, but the changes are not showing up on the STATUS screen.

R. The web browser cache may be the cause of this. If the new configuration does not appear after clicking on Reload or Refresh, then clear the cache or temporary files on the browser.

Q. Will my web server be able to communicate to a credit card validation service, like Cybercash?

R. Yes. Any communication initiated from the internal or private network, the WebMux™ will substitute the IP address of its router LAN interface for the IP address of the host initiating the conversation. For any service that requires a specific IP address to allow communication into their network, the IP address of the router LAN interface must be the one provided. We have had CyberCash engineers work with us to test this.

Q. Can I use the WebMux™ as a proxy server for other hosts in my internal network?

R. Yes. The function that allows the web servers to talk to services such as the credit card validation, allows the WebMux™ to function as a proxy server for any host in the internal network. The WebMux™ will translate all internal addresses to the IP address of the "first farm" defined. This is the farm that is created when answering the question: **WebMux™ Router LAN IP address:**

Configuring other computers using the WebMux's proxy function is easy – just point the gateway IP address to the WebMux™ backend IP address.

Q. Do I need to have a firewall in front of the WebMux™?

- R. In most cases, no. In NAT mode, the WebMux™ blocks all the incoming traffic from router LAN to your internal network. Unless there is a farm defined for a port number, the outside traffic will not be able to reach to any server or computers behind the WebMux™. The WebMux™ does not have the management functionality for restricting which IP address or services an internal host can reach to the outside. If such restriction is desirable, then additional firewall is needed. A firewall is recommended if running the WebMux™ in Transparent mode or Out-of-Path.
- Q. What can I do if the service that I want to load balance is not in the list?
- R. The WebMux™ already supports many different services. If your service is not in the list, you could use generic TCP and/or UDP to set your farm. If that is still not good enough, you may contact us for developing a special service aware module for you. In most cases, there is a very reasonable fee to be charged.
- Q. Why did not the secondary WebMux™ take over when I powered down Primary WebMux™?
- R. Possible reasons: 1) The two WebMux™es are not running on the same version of firmware. Or 2) The secondary WebMux™ not only monitors the primary WebMux™, but a few other things as well. Before it takes over, it makes sure it can reach to the router LAN gateway, as well as at least one server defined in any farm. If the secondary WebMux™ cannot reach to the front router LAN gateway, or if it cannot see any server in any farm, then it will consider that the primary was disconnected or powered down purposely by operator.
- Q. Why VLAN IP address cannot be used as farm IP in OOP WebMux™?
- R. WebMux™ uses VLAN IP to forward the packets to the servers in OOP mode. If that VLAN IP address is also the farm address, then the loopback adapter on the server will have the same IP address. During healthcheck from WebMux, server will not be able to send the reply back to WebMux, since server finds the same IP address on itself.

## Regulations

Notice to the USA

Compliance Information Statement (Declaration of Conformity Procedure) DoC FCC Part 15: This device complies with part 15 of the FCC Rules.

Operation is subject to the following conditions:

- 1) This device may not cause harmful interference, and
- 2) This device must accept any interference received including interference that may cause undesired operation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try one or more of the following measures:
  - Reorient or relocate the receiving antenna.
  - Increase the separation between the equipment and the receiver.
  - Plug the equipment into an outlet on a circuit different from that of the receiver.
  - Consult the dealer or an experienced radio/television technician for help.

Notice for Canada

This apparatus complies with the Class B limits for radio interference as specified in the Canadian Department of Communications Radio Interference Regulations. (Cet appareil est conforme aux norms de Classe B d'interference radio tel que specifie par le Ministere Canadien des Communications dans les reglements d'interference radio.)

Notice for Europe (CE Mark)

This product is in conformity with the Council Directive 89/336/EEC, 92/31/EEC (EMC).

Caution: Lithium battery included with this device. Do not puncture, mutilate, or dispose of batter in fire. Danger of explosion if battery is incorrectly replaced. Replace only with the same or equivalent type recommended by manufacture. Dispose of used Battery according to manufacture instruction and in accordance with your local regulations.

## Appendix 1 – How to Add A Loopback Adapter

For out-of-path mode, a loopback adapter or device similar in function is required. This appendix lists a few different ways to add such a device for different OSes.

### Installing the MS Loopback Adapter

1. Click **Add Hardware** -> Add a new device -> No, I want to select the hardware from a list, and select **Microsoft Loopback Adapter** from the list and click **OK**.
2. At the **MS Loopback Adapter Card Setup** screen hit **OK** to the default of 802.3
3. You should be prompted for the path to the NT setup files. Click **Continue** once the path is correct.
4. Click **Close**. Reboot maybe necessary. Go to step below for **Configuring the MS Loopback Adapter**

### Configuring the MS Loopback Adapter

1. If not there already, goto **Start > Settings > Control Panel > Network > Protocols** tab.
2. Select **TCP/IP** and click the **Properties** button
3. You should be at the **Microsoft TCP/IP Properties** dialog box. Be sure the **MS Loopback Adapter** is the Adapter selected. Enter your farm IP address for **IP address** (**Subnet** should be match your servers, change it if not) Make sure not enter Default Gateway or DNS for this loopback adapter.
4. Click Apply, then OK, then Yes when prompted to restart the computer

For Windows 2003 Server, make sure the metric is the highest number in routing table, stop here. (NOTE: the highest number meaning 1000 is higher than 100. You need to make sure that the Loopback Adapter has the highest number in the routing table. Giving a lower number means a higher priority. You want the Loopback Adapter to have the lowest route priority, therefore a higher number value). For Windows 2000/NT Systems, please proceed to the Appendix 2 for remove the route entry in the routing table.

If you are noticing that the Loopback Adapter is picking up or creating NetBIOS chatter, you will need to turn off anything related to Client for Microsoft Networks, File and Printer Sharing for Microsoft Networks, and WINS. Right click on the Loopback Adapter icon, and click on **Properties**. In the **Networking** tab,

**unselect “Client for Microsoft Networks” and “File and Printer Sharing for Microsoft Networks”.** Next click on **“Internet Protocol Version 4 (TCP/IP)”** then click the **Properties** button. In the **General** tab, click the **Advanced...** button. Click on the **WINS** tab and **unselect Enable LMHOSTS lookup** and select **Disable NetBIOS over TCP/IP**. Click **OK** in the various windows to make all the changes permanent.

For Linux, HP/UX, and FreeBSD perform the following:

**For Linux 2.4/2.6 Systems:**

Login as root, and add this command to the bootup script:

```
iptables -t nat -A PREROUTING -d <farm_ip> -j DNAT --to-dest <server_ip>
```

For IP-based virtual hosting with multiple IPs, repeat the command for each farm IP on all the servers. Don't forget to add the proper farm IP to each virtual host configuration.

With IPv6 addresses, add the IPv6 address of the FARM to “lo” adaptor. Also, be sure that the routing table has an IPv6 entry for the network and a default gateway entry for the real interface of the server. You can check by issuing the “route --inet6” command. See Appendix 8 for other IPv6 related information.

**For SUSE Enterprise Linux 9:**

You can use YAST to set up a Virtual Interface and add the farm IP.

Login as root, and add this command to the bootup script:

```
iptables -t nat -A PREROUTING -d <farm_ip> -j DNAT --to-dest <server_ip>
```

**For HP/UX 11.00 and 11i:**

Please make sure PHNE\_26771 and related patches applied first.

Login as root, and add this command to the bootup script:

```
ifconfig lo0:1 farm_ip_address up
```

**For FreeBSD:**

```
ifconfig lo0 inet farm_ip_address netmask 255.255.255.255 alias
```

**For Solaris:**

```
ifconfig lo0:1 FARM_IP_ADDR
```

```
ifconfig lo0:1 FARM_IP_ADDR FARM_IP_ADDR
```

```
ifconfig lo0:1 netmask 255.255.255.255
```

```
ifconfig lo0:1 up
```

**For Apple Servers:**

```
ifconfig lo0 inet farm_ip_addr netmask 255.255.255.255 alias
```

```
route delete gateway_ip farm_ip_addr netmask
```

Where lo0 is the loopback adapter.

## Appendix 2 - How to make route delete reboot persistent

1. In a Windows system, go to boot drive root by `cd C:\`;
2. Use a text editor to create a text file, in which it contains one line:  
`route delete 10.1.0.0 mask 255.255.0.0 10.1.1.200`
3. In above file 10.1.0.0 is the network destination, 255.255.0.0 is the Netmask for the network, and 10.1.1.200 is the farm address, also is the address for the loopback adapter address.
4. Start Scheduled Task in control panel;
5. Click "add Scheduled Task"; then next;
6. "Browse" to the .bat file we created -- like WebMux.bat under c:\ ;
7. Choose "Perform this task" -- "when my computer starts".

That will delete the route every time the Windows computer reboots. Please make sure after "route delete" the only route left in the routing table for the loopback adapter is this one (your actual IP address and netmask maybe different):

```
10.1.1.255    255.255.255.255  10.1.1.200    10.1.1.200    1
```

All other routes for the loopback adapter must not show in the routing table. On both Windows and Unix, the routing table can be seen by execute this command: "netstat -rn" .

Please note for Windows 2003 servers, the route for the loopback adapter can not be deleted. However, since Windows 2003 server automatically taking a highest metric number, the route does not need to be deleted.

## Appendix 3 - Phone Paging Codes

When an error occurs, the WebMux™ will send an error code to the regular numerical pager assigned in the Administration Setup page. Please refer to the Management Browser - Administration Setup section on setting up phone pager numbers.

To be as compatible as possible to different types of pagers, only numeric error codes are used. The minimum requirement is the pager should be able to display up to 18 digits. If the pager cannot display 18 digits, some codes may get truncated.

### For WebMux™ (Single and with Secondary)

- 99//////////PPPP - A server went down. This 18-digit code (no spaces) starts with 99 followed by 12 digits of the IP address (without the periods) of the server. The last four digits represent the port number of the server.
- 00//////////PPPP - A downed server went back up. This 18-digit code (no spaces) starts with 00 followed by 12 digits of the IP address (without the periods) of the server. The last four digits represent the port number of the server.
- 98//////////[PPPP] – Gateway (router LAN) does not respond. 12 digits number after the 98 is the IP address of the gateway. Port number is optional.
- 01//////////[PPPP] – Gateway comes back in service. 12 digits number after the 01 is the IP address of the gateway. Port number is optional.
- 88//////////PPPP – WebMux™ has detected more connections than the threshold defined in the setup screen.
- 40 - last resort servers taken out of service for a farm.
- 41 - last resort servers put in service for a farm.
- 73 - WebMux™ cannot reach to the back LAN.
- 74 - WebMux™ cannot reach the front LAN.
- 75 - Primary or Secondary cannot reach the other WebMux™ through the serial cable.
- 76 - Serial cable communication restored.
- 55 - User configuration cannot be parsed by WebMux™ (after the configuration restored through browser).

For WebMux™ Primary Only

- 66 - Secondary is not responding.

For WebMux™ Secondary Only

- 71 - Primary failed. Secondary took over from Primary.
- 72 - Primary went back up. Control returns to the Primary.

## Appendix 4 – Virtual Hosting Issues

Servers serving more than one web site may do virtual hosting. The WebMux™ supports virtual hosting by checking the virtual server's response. There are three different situations for the WebMux™ to handle.

If the service is HTTPS, there is no way to do virtual hosting on the same IP address. However, each HTTPS farm can be on a different IP address on the same server. The reason that each HTTPS server must have its own IP address is that any web server software, IIS or Apache, can not see the URL in the HTTPS packets, since they are encrypted. The IIS or Apache server only decrypts the URL after the packet is sent to a particular process. Since no web server software supports virtual hosting HTTPS on the same IP address, the WebMux™ does not need to do anything extra other than load balancing all the packets for that particular farm.

If the service is HTTP, then any web server software, IIS or Apache, can host almost unlimited virtual farms on each IP address. Many hosting centers handle this situation by putting all the servers serving each virtual host on a server farm on the WebMux™. The WebMux™ will load balance the traffic for all the incoming traffic for that IP address to different servers in that farm. During farm setup, the label for the farm could be one of the virtual farm's base URL, say `www.mydomain.com`, the WebMux™ actually periodically reads a page from this URL. If server that serves that URL does not response correctly, the WebMux™ will mark that server dead. Since every server in that farm serves all the virtual farms, the WebMux™ expects the problem with one server in one URL will affect all the URLs in that farm.

Another situation is the server that serves HTTP virtual sites using a single private IP address already before load balancing. After adding load balancer, some the sites want to have their own IP addresses. The WebMux™ allows set up separate farm for each site having its own public IP address, but point to the same sets of servers in the private network. In this situation, each separate farm could have its own label as `www.site1.com` and `www.site2.com`, etc. The WebMux™ will actually do health check on each URL by periodically read a default page from that site.

In the virtual hosting situation, the label and response from the web servers are critical for reliable services. The WebMux™ checks the label and checks the server for its health situation based on the URL supplied in the label. If the server response is 500 or greater, which is an error code indicating server internal error, the WebMux™ will excludes that server from serving the farm. If server responses 402, which indicating access is denied for that virtual farm, the WebMux™ will mark that server dead. We have checked with IIS server and Apache server, they both follow the same rules.

## Appendix 5 – Sample Custom CGI Code

The custom cgi-bin checking program may be written in Java, VB, C, or Perl, for example, or it may be a WB or shell script. Here is sample script written for the linux shell bash which sees if an SSH daemon is running as its check criterion.

```
#!/bin/bash
echo "Content-type: text/plain"
echo      # blank line
if ps -C sshd &>/dev/null ; then
    echo "OK"      # response from server goes here, see list below.
    echo "SSH service available"
else
    echo "NOT OK"
    echo "SSH daemon not running"
fi
```

The following is a list of valid CGI code responses:

OK	- server/service is alive, no weight change
NOT OK	- server/service is dead
OVERLOAD	- set weight to 0, to quiesce (same as "WEIGHT=0")
QUIESCE	- set weight to 0, to quiesce (same as "WEIGHT=0")
WEIGHT=n	- set weight to integer n
WEIGHT-=n	- subtract integer n from the weight
WEIGHT+=n	- add integer n to the weight

The response must be in all capitals to be recognized. The changes in weight count as an unsaved configuration change. It is not automatically saved. Anything not matching the above list will cause the WebMux™ to believe the server is not responding properly, thus the server will be taken out of service.

When the WebMux™ sends its health check, it will provide information in a query string that can be passed to your custom health check script. For example, the actual request from the WebMux will include the query string:

```
/custom?farm=<IP>:<PORT>&server=<IP>:<PORT>&alive=1&standby=0&favorite=0&lastresort=0&weight=1
```

"farm" and "server" each consist of a dotted quad IP address followed by a colon and a port number (a server port of 0 means the port is the same as what is specified on the farm IP). "weight" is the numerical weight. The remaining items are either 0 for false or 1 for true.

You can have your script access the query string elements for further processing.

Also, the MIME header of the custom health check request will include the “Host:” and “User-Agent:”. The “Host:” MIME header will be the label you used for the farm (not the label you use for the server). The “User-Agent:” MIME header will show “WebMux health check for <farm IP>:<port>.”

Note the HTTP server will also have its own environment variables that you can utilize for your custom health check script. Please refer to your HTTP server manual and the manual for your scripting language for more information about environment variables.

## Appendix 6 – Access CLI Commands

Once the diagnose ports set, superuser could use ssh or telnet to access the CLI commands to help troubleshoot network problems or server problems. There are maximum two diagnose ports. By default they are 77:87. The first one will be SSH and second one will be Telnet. If there is only one port specified, only SSH access is allowed.

```
“ssh -l superuser -p port_number WebMux_ip_address”
```

Can be issued from any Linux/Unix computer. For Windows computer, PuTTY can be freely downloaded over Internet.

Once logged into the CLI, the following screen will be shown:

Enter "help" for list of commands.

Enter “cmd --help” give help for the command "cmd".

Enter "exit" or "logout" to end this session.

Following are commands available in CLI:

arp - manipulate the system ARP cache

arping - ping <address> on device <interface> by ARP packets, using source address <source>.

brctl – manually manipulate Ethernet bridge properties when the WebMux™ is in Transparent Mode.

ethtool – allows you to display the status or manipulate the settings of the Ethernet hardware.

factory\_reset – reset WebMux™ settings to original settings, clear all current setting.

getallsettings - save all WebMux™ settings from WebMux™ to your PC

getconfig – save all farm/server settings from WebMux™ to your PC

ifcfg-eth – In Out-of-Path mode, you can use this command to set a reboot permanent IP address on the “Internet” port (ethf0). See Appendix 10 for details.

ifconfig – display and configure a network interface(s)

iptables – allows you to create custom packet filtering for the WebMux™. The changes made here are not reboot persistent.

ip6tables – version of iptables for IPv6

netstat – display network connections, routing tables, interface statistics, etc.

nwconfig – allows you create additional networks for use in multiple ISP configurations and/or for multiple server subnets in NAT mode. See Appendix 11 for more details.

ping - send ICMP ECHO\_REQUEST packets to network hosts

ping6 – version of ping command for IPv6

poweroff – initiates the proper shutdown sequence

putconfig - restore farm/server settings from your PC to WebMux™

reboot – initiates a soft reboot.

restart – restarts the WebMux™'s internal processes without rebooting the hardware.  
rec\_cmdline – allowing configure basic WebMux™ IP without using pushbutton.  
route – manipulate or display the routing table. Settings made here ARE reboot persistent.  
sysinit - allows you to create a custom startup script. (Useful for making custom iptables rules reboot permanent, etc.).  
tcpdump – capture and display network traffic  
traceroute - print the route packets take to network host

Most commands can be found on Unix, for detailed usage, please refer to any Unix man pages. Our support center does not support the usage of these commands.

## Appendix 7 – Extended Regular Expressions

Extended Regular Expressions is a powerful system for filtering and matching string patterns. Although you may be familiar with the wildcard characters used in DOS or Linux command lines, such as the “?” and “\*”, it is important to point out that these characters do not mean the same thing in Extended Regular Expressions. The “?” and “\*” are called quantifiers and they by themselves do not represent actual characters. The wildcard character in Extended Regular Expressions is the period (“.”). However, the “.” only represents a single instance of any character (the way the “?” is normally understood in command lines). A quantifier, in Extended Regular Expressions, tells you how many times an element to its left is allowed to occur and still be considered a valid match. A “?” says that the element to its left is allowed to occur zero or one time. For example, “colou?r” will match both “color” and “colour” because the “u” can either not occur at all or occur only one time in the string to be valid. The string “colouur” will not be a valid match in this example. The “\*” means that the element to its left can occur zero or more times. So, “colou\*r” will match “color” or “colour” or “colouur” or “colouuur” and so on. Quantifiers require that it is preceded with an element (or character). So, to get the same result as an “\*” by itself in a command line, you must use “.\*” in Extended Regular Expressions. “.\*” meaning match any character (“.” being the wildcard character) occurring zero or more times in the string (as dictated by the “\*” quantifier).

Here are other example patterns:

An item which has the string "Compiler" in it.

Compiler

Items with various spellings of "Dijkstra" with the j replaced by any character

Di.kstra

Items with various spellings of "Dijkstra" with the "ijk" replaced by any number of characters

D.\*stra

An item with either "Compiler" or "compiler" in it.

[cC]ompiler

String like bananas, bananananas, bananananas etc.

bana(na)+s

Items with the strings "regular" and "expression" on the same line with anything or nothing between them

`regular.*expression`

Items with either regular or expression (or both).

`regular|expression`

Items with either OO or "Object Oriented" or "Object-Oriented" on one line.

`OO|([oO]bject( |\-)[oO]riented)`

To search for characters other than letters or digits put a "\" in front of them.

`S\SL`

These examples were taken from the following web page:

<http://www.csci.csusb.edu/dick/samples/egrep.html>

You can also find helpful information at [http://en.wikipedia.org/wiki/Regular\\_expression](http://en.wikipedia.org/wiki/Regular_expression)

## Appendix 8 – Notes on IPv6

Because IPv6 uses the colon (:) symbol in the address, there are special considerations needed when using the IPv6 address in a web browser because the colon (:) is also used to denote a port number (i.e. 192.168.12.21:24). Because accessing the WebMux's web management requires access to port 24, you cannot simply put the IPv6 address in the address bar of the browser like you would for an IPv4 address. You must enclose the address in brackets ([]). For example, if the IPv6 address of the WebMux is fec0::c0a8:c15, then you would enter `http://[fec0::c0a8:c15]:24/cgi-bin/login` to get to the web management.

There are also IPv6 versions of some basic networking tools such as ping6, traceroute6, and tcpdump with the IPv6 flag, `ip -f inet6`, `route -inet6`, etc. Please be sure that network software/client is indeed IPv6 capable or is the correct IPv6 version to use before assuming that your network is not working.

Also, when adding an IPv6 address to your server's NIC (network interface card), your server's OS might not automatically add a default gateway in its routing table for the IPv6 address. Please double check the routing tables and make sure the proper entries are there. If your servers are not accessible from the outside but are accessible within the subnet, you might want to check and make sure that the default gateway was set up correctly.

## Appendix 9 – WebMux SNMP MIB Query ID

.1.3.6.1.4.1.27182.3.1.1.1.11.0

caiWebMuxActive.0

SYNTAX INTEGER { true(1), false(2) }

DESCRIPTION "Whether this WebMux unit is active."

---

.1.3.6.1.4.1.27182.3.1.1.1.7.0

caiWebMuxCPUSpeed.0

SYNTAX Integer32

UNITS "MHz"

DESCRIPTION "The clock speed of the CPU(s) in this unit."

---

.1.3.6.1.4.1.27182.3.1.1.1.9.0

caiWebMuxCPUUsage.0

SYNTAX Unsigned32

UNITS "%"

DESCRIPTION "The current CPU usage expressed as a percentage."

---

.1.3.6.1.4.1.27182.3.1.1.1.8.0

caiWebMuxCPUs.0

SYNTAX Unsigned32

DESCRIPTION "The number of CPUs in this unit."

---

.1.3.6.1.4.1.27182.3.1.1.3.1.9.x.y

caiWebMuxFarmAddressBlockNonSSL.x.y

SYNTAX INTEGER { true(1), false(2) }

DESCRIPTION "If the value of this object is true(1), then connections to the IP address given for this row that are not using SSL will not be accepted."

---

.1.3.6.1.4.1.27182.3.1.1.3.1.5.x.y

caiWebMuxFarmAddressIPv4.x.y

SYNTAX IpAddress

DESCRIPTION "An IPv4 address used to access the service provided by this server farm."

---

.1.3.6.1.4.1.27182.3.1.1.3.1.6.x.y

caiWebMuxFarmAddressIPv6.x.y

SYNTAX OCTET STRING (16)

DESCRIPTION "An IPv6 address used to access the service provided by this server farm."

---

.1.3.6.1.4.1.27182.3.1.1.3.1.3.x.y

caiWebMuxFarmAddressLabel.x.y

SYNTAX OCTET STRING (0..255)

DESCRIPTION "The mnemonic label assigned to this address and port for a server farm."

---

.1.3.6.1.4.1.27182.3.1.1.3.1.7.x.y

caiWebMuxFarmAddressPort.x.y

SYNTAX Unsigned32 (1..65535)

DESCRIPTION "A TCP or UDP port number used to access the service provided by this server farm."

---

SYNTAX OCTET STRING (0..255)

DESCRIPTION "The WebMux firmware version running this WebMux unit."

## Appendix 10 – Special Details About Out-of-Path Mode

Since firmware version 8.2.03, the WebMux bonds the “Internet” and “Server” ports in a Link Aggregation Group. If you have switch that has “LAG”, or “Ether Channel”, or “Port Channel” capabilities, the “Internet” and “Server” interfaces will behave as a single interface and effectively double the amount of data throughput. Prior to version 8.2.03, the “Internet” port was deactivated in Out-of-Path mode.

It may be desirable to use the “Internet” port for a completely separate network (i.e. for internal management), but because of port bonding it is not possible without direct modification to the WebMux.

Starting with version 8.4.00, a command utility “ifcfg-eth” has been introduced to allow the end user to re-assign the “Internet” port, effectively disabling the link aggregation, and allowing these changes to be reboot persistent.

The general usage of this command is:

***ifcfg-eth [-v vtag] eth netaddr [netmask]***

*vtag (optional)* is the VLAN ID for the interface.

*eth* is interface you want to reassign (“Internet” port = ethf0)

*netaddr* is the IP address you want to assign.

*netmask* is automatic according to the IP block, or you can specifically assign it here.

**PLEASE REBOOT THE WEBMUX WITH THE “reboot” COMMAND TO COMPLETE THE CHANGES.**

## Appendix 11 - Tagged VLAN and WebMux

VLANs may be untagged and tagged. To use untagged VLANs, also known as port based VLANs, no additional configuration of the WebMux is necessary. To the WebMux it appears as if no VLANs are used, and VLAN configuration is done on the switches. This appendix will discuss using tagged VLANs, also known as 802.1q VLANs for the original networks configured on the WebMux.

When you configure the WebMux original network addresses and masks, whether with the front keypad and LCD (see Initial Configuration, page 25), the browser screen (see Initial Setup Change through Browser, page 84), or through the superuser's command line interface with `rec_cmdline` (see Appendix 6), you may also specify VLAN tagging for these networks. VLAN tagging is optional. If it is used, the switches to which the WebMux is connected must also be configured correctly to use these tags. (When additional networks are configured for the WebMux using the superuser's command line utility `nwconfig`, you may also arrange for their VLAN tagging at that time. See Appendix 12.)

Besides configuring the WebMux to use VLAN tags, the switches to which the WebMux is connected must be configured to use these tags. In most switches, there are three items to be addressed when setting up VLANs: the VLAN name, the port participation, and if it will be tagged or untagged.

First a VLAN must be chosen and named. Choosing a VLAN name on the switch does not automatically determine whether its VLAN is tagged or untagged. It merely specifies its name.

Once the VLAN name has been chosen, you must next select which ports participate in this VLAN. If the port selection does not match the physical connectivity, traffic will not pass.

The third and very important setting to make sure is that the port on the switch connected to the WebMux™ will accept correctly tagged VLAN packets only. In some switches, you must first configure the port to use `.general` mode and then specify that the port will be tagged. If you plan to use more than one VLANs, you may configure the switch port to be trunk port, or add multiple VLAN tags to it.

At this point you should be able to access the WebMux™ from other devices that are also using the same tagged VLAN ID.

There are some specific considerations when configuring VLAN IDs in NAT, Transparent, or Out-of-Path mode. In NAT mode, you have the option to have a VLAN ID for both the Router (Internet) LAN interface and the Server LAN interface. Even though the WebMux™ will allow for both sides to have the same

VLAN ID, it is still recommended that you have a different VLAN ID for each to ensure complete network separation between both sides.

In Transparent mode, you will only have one Bridge IP address, but you will need to create a VLAN ID on both the Router (Internet) LAN interface and the Server LAN interface. The WebMux™ will allow you to create the same VLAN ID on both interfaces, but this is not recommended, unless each physical side is on a separate switch completely isolated from each other. Be careful of Ethernet Bridge loops.

In Out-of-Path mode, you only have one VLAN ID to assign for the original network since the WebMux only uses one network for both incoming traffic from clients and outgoing traffic to the servers. In Out-of-Path mode, the Internet LAN interface and Server LAN interface are bonded in a Link Aggregation Group, and both interfaces have identical configuration (unless the port bonding is specifically disabled - see Appendix 10).

## Appendix 12 – Multiple Uplink/VLAN Support

As of version 8.5.00, the WebMux™ now has multiple uplink capabilities. You can configure this feature using the command line interface command:

**nwconfig** - additional network configuration add/list/delete/install tool

With multiple uplink, you can configure the WebMux™ to use multiple ISPs and gateways. The WebMux™ uses source based routing to be sure that packets that came in from one ISP will return through the same ISP. All uplinks are useable simultaneously. Once you have configured farms on both networks, the WebMux™ will monitor the default gateways of the different uplinks and failover to any available ISPs should one ISP go down.

To set up multiple uplinks, first log into the command line interface via telnet on port 87 or ssh on port 77. We will refer to the main network configuration of the WebMux (the IP addresses created via the LCD setup or the “rec” page in the web GUI or rec\_cmdline from the CLI) as the “original” network. Networks created with the “nwconfig” command will be referred to as “additional” networks.

Usage:

```
nwconfig -A|--add NAME -i|--ipaddr IPADDR [other options]
nwconfig -D|--delete NAME
nwconfig -I|--install NAME
nwconfig -L|--list [PATTERN ...]
nwconfig -R|--replace NAME -i|--ipaddr IPADDR [other options]
nwconfig -U|--uninstall NAME
```

For the -A or --add case, the -i or --ipaddr option is required, but other options are optional. Whatever information they supply is used, and what information they don't supply is calculated from the supplied information as best possible. However if an external gateway address for routing is to be used, it must be supplied with -g or --gateway.

options:

```
-A|--add NAME          add new network configuration NAME
-D|--delete NAME      delete existing network configuration
                       NAME
-I|--install NAME     install network described by network
                       configuration NAME
-R|--replace NAME     like -A, except allows configuration to
                       already exist
-U|--uninstall NAME   uninstall network described by network
                       configuration NAME
-b|--broadcast BROADCAST broadcast address is BROADCAST, e.g.
                       192.168.14.255
-g|--gateway GATEWAY  address of gateway/router on the network
```

is GATEWAY, e.g. 192.168.14.1

--help|--usage print this usage message

-i|--ipaddr IPADDR WebMux's IP address on the network is IPADDR, e.g., 192.168.14.22

-L|--list [PATTERN ... ] list existing additional network configurations whose name match the given pattern(s). If no pattern is given, list all additional network configurations.

-m|--netmask NETMASK network mask for the network is NETWORK, e.g., 255.255.255.0

-n|--network NETWORK address of the network is NETWORK, e.g., 192.168.14.0

-r|--router-vid VID VLAN ID for the network for the router in transparent mode

-s|--server-vid VID VLAN ID for the network for the servers in transparent mode

-p|--prefix PREFIX network mask as a prefix width is PREFIX, e.g., 24

-v|--vid VID VLAN ID for the network is VID  
default: original VLAN tag

For example:

```
nwconfig -A newISP -i 192.168.14.21 -g 192.168.14.1
```

The IP you specify will be the WebMux™'s main IP on the additional network.

To activate the configuration immediately without rebooting:

```
nwconfig -l newISP
```

If you need to assign VLAN ID for the additional network use the -v option:

```
nwconfig -A newISP -i 192.168.14.21 -g 192.168.14.1 -v 200
```

In NAT mode, if you do not specify a gateway IP, the new network will be put on the Server LAN side.

If you will be pairing up WebMuxes in a failover configuration, we recommend that you perform these preliminary configurations first before attempting to connect the two units together.

**IMPORTANT CONSIDERATIONS PERTAINING ONLY TO ADDITIONAL NETWORK CONFIGURATIONS.**

**NAT MODE VLAN AND SERVER LAN GATEWAY IP:**

In NAT mode, the interface assigned for the additional network depends on whether or not you specify a gateway IP. If you specify, a gateway IP, the additional network IP will be configured on the Router (Internet) LAN interface for multiple uplink. Otherwise, it will be used on the Server LAN interface to create additional networks for the server LAN side.

We recommend that you set up different tagged VLANs for each additional network you set up for the WebMux™.

If you already have a VLAN ID configured for your original network configuration and you do not specify a VLAN ID for your additional network configuration with `nwconfig`, the additional network will use the same VLAN ID that you specified for your original network configuration. Even though the WebMux™ allows for this kind of configuration, it is generally not recommended. We suggest that all separate networks be on separate VLAN IDs.

Also, you cannot create an additional network with a VLAN ID unless the original network is also configured with a VLAN ID. This is true for all modes (NAT, Transparent, and Out-of-Path). Generally, it is not recommended that you create additional networks unless you are using VLANs.

If you are pairing up two WebMuxes in a failover configuration, you can use the same Router (Internet) LAN and Server LAN IP address for the additional networks in both the primary and secondary units. In NAT mode, the Router (Internet) LAN and Server LAN interfaces are deactivated when the unit is in standby to eliminate duplicate IP address issues and to allow you to conserve available IP addresses.

In the original network configuration you had to specify a “server LAN gateway IP” to be used as the servers’ default gateway IP address. The “server LAN gateway IP” is a floating IP address that is available only on the active WebMux™ in a WebMux™ pair. When creating additional network configurations on the server side, you do not have the option to create a “server LAN gateway IP” like the original network configuration. In this case, you will need to configure your additional server networks using the same IP addresses on the secondary as with the primary. The IP address you create for you additional server network will be used as the server’s default gateway IP. Since only the active WebMux™ will have this IP enabled on its interface, you will not have a duplicate IP address between both units. If one unit goes out of service, the IP address becomes available on the other unit and the servers can continue to communicate to the external network uninterrupted.

TRANSPARENT MODE VLAN:

In Transparent mode, it is recommended that you assign a different VLAN ID for the physical front and back interfaces with the `-r (--router_vid)` and `-s (--server_vid)` flags. For example:

```
nwconfig -A tm_vlan -i 192.168.14.21 -g 192.168.14.1 -r 200 -s 300
```

If you use the `-v` flag, both the physical front and back interfaces will have the same VLAN ID. It is not recommended that you use the same VLAN ID for the front and back interfaces in Transparent mode.

#### OUT OF PATH MODE VLAN AND SERVER LAN GATEWAY:

When creating an additional network in Out-of-Path mode, it is important that your farm IPs are different from the main IP address you create with the “nwconfig” tool. This is important because the main IP address you create will be the IP address the WebMux™’s health checks will appear to come from. You will have problems with Windows servers if you use a farm IP that is the same as the main IP. This is because Windows utilizes the MS Loopback Adapter with the farm IP. When the WebMux™ send its health check request coming from the main IP, the Windows machine will see that the IP address is on its Loopback Adapter and will not send back a reply since it believes it is coming from itself. The WebMux™ will mark the server dead since it will not receive a reply. To ensure that this will not occur, do not use a farm IP that is the same as the main IP in Out-of-Path Mode.

It is important to remember that when you are doing SSL termination or Layer 7 load balancing that you must point your servers’ default gw back to the WebMux™. In the original network configuration, you had an option to create a “server LAN gateway IP”. The servers used this IP address as their default gateway IP. This IP is a floating IP that transfers between WebMuxes in a failover configuration. Only the active WebMux™ will have that IP address available on its network interface to avoid duplicate IP address issues. Additional network configurations do not have the option to create a “server LAN gateway IP” like the original network configuration. In this case, you will need to use the FARM IP as your servers’ default gateway IP address. Since the FARM IPs are only available on the active WebMux™ they will effectively serve as the floating server LAN gateway IP.

## Appendix 13 - How to Add Commands to WebMux™ Startup Sequence

Sometimes there is a need to add commands to the WebMux™ startup sequence so that certain commands can be reboot persistent. In 8.5.02 firmware release and later, there is a new superuser command "sysinit" provided for the user to add iptables command or other commands to the startup sequence. Please note that adding a wrong command to the startup sequence may render the WebMux™ not accessible, thus it is always a good practice to test the commands first before adding it to the WebMux startup sequence.

For example, if you want an SMTP server at 192.168.10.98 always appear to be sent from one of your public IP addresses (i.e. 66.1.1.98) on the WebMux™, you can use this iptables command:

```
iptables -t nat -I POSTROUTING -s 192.168.10.98 -d ! 192.168.10.98 \  
-m multiport -p tcp --destination-ports 25 -j SNAT --to-source 66.1.1.98
```

This command works the moment it is issued, but when you reboot the WebMux™, it gets lost. To make it reboot persistent, you want to add it to the WebMux™ startup sequence. You can use the sysinit command to add the above command to the sysinit table in the WebMux™, so that it will always be executed during the WebMux™ startup.

The sysinit command has following syntax:

```
$ sysinit --help  
usage: sysinit [--help] [--quiet] [--write]  
--help    print help  
--quiet   skip prompts and confirmation  
--write   write stdin to superuser's sysinit script table  
          (without parameter will read existing table) The superuser's sysinit table may  
          contain any commands that are allowed at the superuser's command prompt. At  
          system startup, it will be run after networking has been started.
```

If typing or pasting new input, use control-D for EOF.

```
$ sysinit --write  
sysinit: Enter new script up to EOF (cntl-D):  
echo AAA >/dev/console  
sysinit: You entered 23 bytes. [done]  
$ sysinit  
sysinit: reading sysinit file:  
echo AAA >/dev/console  
sysinit: sysinit file contains 23 bytes. [done]
```

For the purpose of the above example, the echo AAA will be saved in the sysinit table. If you want to add a new command, it is always good idea to test them before adding to the sysinit table. To clear the sysinit table, use a space and control-D to write a blank table into sysinit table. Please note that sysinit table will not be send over to the backup WebMux™. In case the wrong command caused user no longer able to login into WebMux™, use the LCD "factory reset" to reset the sysinit table to blank.

## Appendix 14 - Using the “Bond All Interfaces” Feature

As of firmware version 8.5.04, when you specify a non-zero VLAN ID in NAT Mode or Transparent Mode, you will be given an additional option to “Bond rtr/svr NI”. This feature allows you to use the “Internet” and “Server” ports as a “single” bonded interface (also known as Port Channel or Link Aggregation Group). When this option is enabled, the traditional “front” and “back” LAN of the WebMux is no longer partitioned on the WebMux itself, rather, on the network SWITCH using tagged and untagged VLAN ID settings.

Specific concepts need to be followed when setting up the WebMux with VLAN IDs. One is that the ports on the switch connected to the WebMux MUST be configured to be using “tagged” VLAN (802.1q). VLAN IDs configured on the WebMux for any mode (NAT, Transparent, or Out-of-Path) is a “tagged” VLAN (802.1q) specification. For the rest of the network, there are two ways to configure the switch and devices in order for them to be able to communicate with each other. One way is to make all the devices in the local network use 802.1q VLAN tagging, since only devices using 802.1q VLAN tagging will be able to communicate with each other. However, that option depends on the actual network interface in the device and whether or not it supports 802.1q VLAN tagging. The other option is to leave the network interface configuration on the other devices alone and configure the switch to do the VLAN tagging. This will be the option that we will be using in our example. All manageable switches with VLAN capabilities have these features, but since the switch configuration commands vary from brand to brand, we will only lay out the main configuration concepts and leave it up to you to refer to your switch user manual for specifics.

In the following example, we will be configuring a WebMux in NAT Mode using the “Bond rtr/svr NI” option enabled:

```
RTR LAN IP: 192.168.12.21
RTR LAN mask: 255.255.255.0
SVR LAN IP: 192.168.11.21
SVR LAN mask: 255.255.255.0
RTR LAN vlan id: 100
SVR LAN vlan id: 200
Bond svr/rtr NI? YES
SVR LAN gateway IP: 192.168.11.1
External Gateway IP: 192.168.12.1
```

On the switch, we will be connecting ports 1 and 2 to the “Internet/rtr” port and “Server/svr” ports of the WebMux. We will designate ports 3, 4, 5, and 6 for the “Front/Internet” LAN and ports 7, 8, 9, and 10 for the “Back/Server” LAN.

First you will need to create a “port channel” or “link aggregation group” that includes physical ports 1 and 2. In most switches your real ports are designated by 0/1, 0/2, and so on. When you create a port channel, a new interface may be created designated by 1/1 for example.

Next, you will assign the VLAN IDs to the PORT-CHANNEL interface (1/1). First, configure the port-channel interface to “participate” or “include” VLAN 100 and make sure that it is TAGGED. Then, configure the port-channel interface to “participate” or “include” VLAN 200 and make sure that it is TAGGED. The port-channel interface should now be part of both VLAN 100 and VLAN 200 using TAGGED VLAN.

Now, configure the switch to use ports 3, 4, 5, and 6 for the “Front/Internet” LAN. The devices connected these ports will not be using any VLAN configurations. The switch will be configured to accept incoming “untagged” packets and automatically assign a VLAN ID to those packets. In this case, you will be using VLAN ID 100. First, you will configure ports 3, 4, 5, and 6 to “participate” or “include” VLAN 100 and make sure that you specify that it is UNTAGGED. On some switches, that means you have to first issue the command to have the port “participate” on VLAN 100, then you have no issue a “no vlan tagging 100” command. Next is very important to make this portion work properly, you must make these ports “accept all frames” AND you must assign them the PVID of 100. If you are unsure where, or how, to set the PVID, then please refer to your switch user manual. This tells the switch that these ports are part of VLAN 100, the data from the devices connected will be untagged and it should accept it anyway, and finally the switch will automatically assign a VLAN ID of 100 to these untagged packets. At this point, assuming that your device has a 192.168.12.0/24 address, you should now be able to ping the WebMux rtr LAN IP address of 192.168.12.21.

Finally, on the “server” side you will configure the switch to use ports 7, 8, 9, and 10 for the “Back/Server” LAN. Again, the devices on these ports will not be using any VLAN configurations. The switch will be configured to accept incoming “untagged” packets and automatically assign a VLAN ID to those packets. Your “server” side VLAN ID is 200. You will need to configured port 7, 8, 9, and 10 to “participate” or “include” VLAN 200 and make sure that you specify that it is UNTAGGED. Next you will need to make these ports “accept all frames” AND you must assign them the PVID of 200. Again, please refer to your switch user manual for specific commands. At this point, any device connected to port 7, 8, 9, or 10 (and assuming that it already has a 192.168.11.0/24 address), you should now be able to ping the WebMux svr LAN IP address of 192.168.11.21.
